# Introduction

Unpolarized Deep-Inelastic Scattering (DIS):

$$W_{\mu\nu}(q, P, s) = \frac{1}{4\pi} \int d^4\xi \exp(iq\xi) \langle P, s | [J_\mu^{em}(\xi), J_\nu^{em}(0)] | P, s \rangle =$$

$$\frac{1}{2x} \left( g_{\mu\nu} - \frac{q_\mu q_\nu}{q^2} \right) F_L(x, Q^2) + \frac{2x}{Q^2} \left( P_\mu P_\nu + \frac{q_\mu P_\nu + q_\nu P_\mu}{2x} - \frac{Q^2}{4x^2} g_{\mu\nu} \right) F_2(x, Q^2) .$$

Structure Functions:  $F_{2,L}$

contain light and heavy quark contributions.

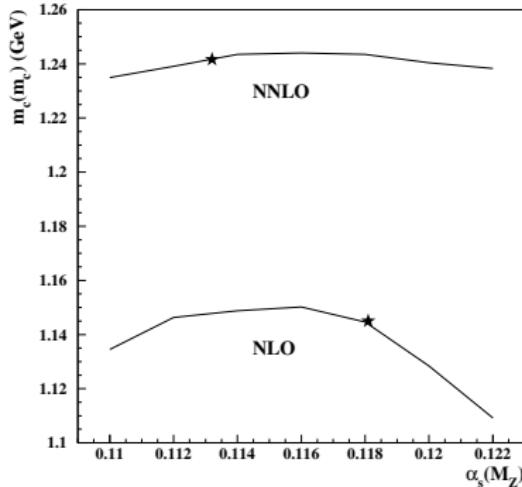

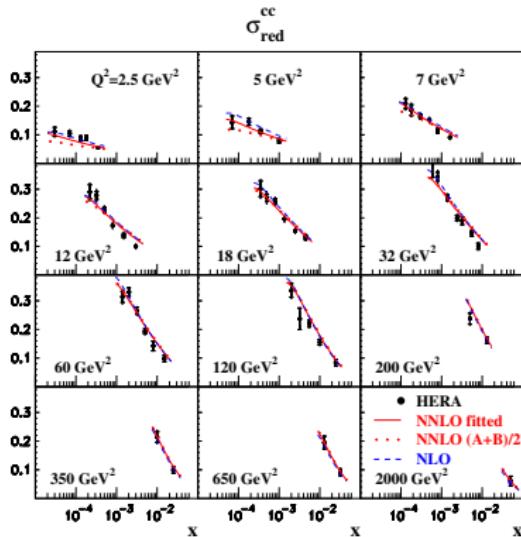

## $\alpha_s(M_Z^2)$ from NNLO DIS(+) analyses

# Factorization of the Structure Functions

At leading twist the structure functions factorize in terms of a Mellin convolution

$$F_{(2,L)}(x, Q^2) = \sum_j \underbrace{\mathbb{C}_{j,(2,L)} \left( x, \frac{Q^2}{\mu^2}, \frac{m^2}{\mu^2} \right)}_{\text{perturbative}} \otimes \underbrace{f_j(x, \mu^2)}_{\text{nonpert.}}$$

into (pert.) **Wilson coefficients** and (nonpert.) **parton distribution functions (PDFs)**.

$\otimes$  denotes the Mellin convolution

$$f(x) \otimes g(x) \equiv \int_0^1 dy \int_0^1 dz \delta(x - yz) f(y) g(z) .$$

The subsequent calculations are performed in Mellin space, where  $\otimes$  reduces to a multiplication, due to the Mellin transformation

$$\hat{f}(N) = \int_0^1 dx x^{N-1} f(x) .$$

Wilson coefficients:

$$\mathbb{C}_{j,(2,L)}\left(N, \frac{Q^2}{\mu^2}, \frac{m^2}{\mu^2}\right) = \textcolor{blue}{C}_{j,(2,L)}\left(N, \frac{Q^2}{\mu^2}\right) + H_{j,(2,L)}\left(N, \frac{Q^2}{\mu^2}, \frac{m^2}{\mu^2}\right).$$

At  $Q^2 \gg m^2$  the heavy flavor part

$$H_{j,(2,L)}\left(N, \frac{Q^2}{\mu^2}, \frac{m^2}{\mu^2}\right) = \sum_i \textcolor{blue}{C}_{i,(2,L)}\left(N, \frac{Q^2}{\mu^2}\right) \textcolor{red}{A}_{ij}\left(\frac{m^2}{\mu^2}, N\right)$$

[Buza, Matiounine, Smith, van Neerven 1996 Nucl.Phys.B] factorizes into the light flavor Wilson coefficients  $\textcolor{blue}{C}$  and the massive operator matrix elements (OMEs) of local operators  $O_i$  between partonic states  $j$

$$\textcolor{red}{A}_{ij}\left(\frac{m^2}{\mu^2}, N\right) = \langle j | O_i | j \rangle.$$

→ additional Feynman rules with local operator insertions for partonic matrix elements.

The unpolarized light flavor Wilson coefficients are known up to NNLO

[Moch, Vermaseren, Vogt, 2005 Nucl.Phys.B].

For  $F_2(x, Q^2)$ : at  $Q^2 \gtrsim 10m^2$  the asymptotic representation holds at the 1% level.

# Status of OME calculations

Leading Order: [Witten 1976, Babcock, Sivers, Wolfram 1978, Shifman, Vainshtein, Zakharov 1978, Leveille, Weiler 1979, Glück, Reya 1979, Glück, Hoffmann, Reya 1982]

Next-to-Leading Order:

[Laenen, van Neerven, Riemersma, Smith 1993]

$Q^2 \gg m^2$ : via IBP [Buza, Matiounine, Smith, Migneron, van Neerven 1996]

Compact results via  ${}_pF_q$ 's [Bierenbaum, Blümlein, Klein, 2007]

$O(\alpha_s^2 \varepsilon)$  (for general  $N$ ) [Bierenbaum, Blümlein, Klein 2008, 2009]

Next-to-Next-to-Leading Order:  $Q^2 \gg m^2$

- ▶ Moments for  $F_2$ :  $N = 2 \dots 10(14)$  [Bierenbaum, Blümlein, Klein 2009]  
mapping large expressions to [MATAD, Steinhauser 2000]
- ▶ Contributions to transversity:  $N = 1 \dots 13$  [Blümlein, Klein, Tödtli 2009]
- ▶ Two masses  $m_1 \neq m_2 \rightarrow$  Moments  $N = 2, 4, 6$  [JB, Wißbrock 2011]

At 3-loop order for general values of  $N$ :

- ▶ All OMEs: terms  $O(n_f T_F^2 C_{A/F})$  to  $F_2$  [Ablinger et al. 2011, 2012]
- ▶ First contributions to  $O(T_F^2 C_{A/F}) A_{gg,Q}$  [Ablinger et al. 2014]

 & O_{\mu\nu\lambda\sigma}(p_1, p_2, p_3, p_4) = \Delta_{\nu} \Delta_{\lambda} \left\{ -g_{\mu\sigma} (\Delta \cdot p_3 + \Delta \cdot p_4)^{N-2} \right. \\
 & \quad + [p_{4,\mu} \Delta_{\sigma} - \Delta \cdot p_4 g_{\mu\sigma}] \sum_{i=0}^{N-3} (\Delta \cdot p_3 + \Delta \cdot p_4)^i (\Delta \cdot p_4)^{N-3-i} \\
 & \quad - [p_{1,\sigma} \Delta_{\mu} - \Delta \cdot p_1 g_{\mu\sigma}] \sum_{i=0}^{N-3} (-\Delta \cdot p_1)^i (\Delta \cdot p_3 + \Delta \cdot p_4)^{N-3-i} \\
 & \quad + [\Delta \cdot p_1 \Delta \cdot p_4 g_{\mu\sigma} + p_1 \cdot p_4 \Delta_{\mu} \Delta_{\sigma} - \Delta \cdot p_4 p_{1,\sigma} \Delta_{\mu} - \Delta \cdot p_1 p_{4,\mu} \Delta_{\sigma}] \\
 & \quad \times \sum_{i=0}^{N-4} \sum_{j=0}^i (-\Delta \cdot p_1)^{N-4-i} (\Delta \cdot p_3 + \Delta \cdot p_4)^{i-j} (\Delta \cdot p_4)^j \\
 & \quad \left. - \left\{ \begin{array}{l} p_1 \leftrightarrow p_2 \\ \mu \leftrightarrow \nu \end{array} \right\} - \left\{ \begin{array}{l} p_3 \leftrightarrow p_4 \\ \lambda \leftrightarrow \sigma \end{array} \right\} + \left\{ \begin{array}{l} p_1 \leftrightarrow p_2, p_3 \leftrightarrow p_4 \\ \mu \leftrightarrow \nu, \lambda \leftrightarrow \sigma \end{array} \right\} \right\}, \quad N \geq 2
 \end{aligned}$$

The diagrams are generated using **QGRAF** [Nogueira 1993 J. Comput. Phys].

	$A_{qq,Q}^{(3),\text{NS}}$	$A_{gq,Q}^{(3)}$	$A_{Qq}^{(3),\text{PS}}$	$A_{gg,Q}^{(3)}$	$A_{Qg}^{(3)}$
No. diagrams	110	86	125	642	1233

A **FORM** [Vermaseren 2000] program was written in order to perform the  $\gamma$ -matrix algebra in the numerator of all diagrams, which are then expressed as a linear combination of scalar integrals.

$A_{qq,Q}^{(3),\text{NS}}$  → 7426 scalar integrals.

$A_{gq,Q}^{(3)}$  → 12529 scalar integrals.

$A_{Qq}^{(3),\text{PS}}$  → 5470 scalar integrals.

⇒ Need to use integration by parts identities.

⇒ The reduction for all OMEs has been completed.

⇒ Use special computers: 12 units with overall 3.2 TB RAM,  
97 TB fast disc, hundreds of mathematica lic. ; IBP: several TB  
of final relations.

# Integration by parts

We use **Reduze** [A. von Manteuffel, C. Studerus, 2012] to express all scalar integrals required in the calculation in terms of a small(er) set of master integrals.

Reduze is a **C++** program based on **Laporta's algorithm**.

$$(\Delta \cdot k)^N \rightarrow \sum_{N=0}^{\infty} x^N (\Delta \cdot k)^N = \frac{1}{1 - x\Delta \cdot k}$$

⇒ additional propagator.

**Number of master integrals:**

$A_{qq,Q}^{(3),NS}$  → 35 master integrals ✓.

$A_{gq,Q}^{(3)}$  → 41 master integrals ✓.

$A_{Qq}^{(3),PS}$  → 66 master integrals ✓.

$A_{gg,Q}^{(3)}$  → 205 master integrals ✓.

$A_{Qg}^{(3)}$  → 340 master integrals. (224 done by last Tuesday.)

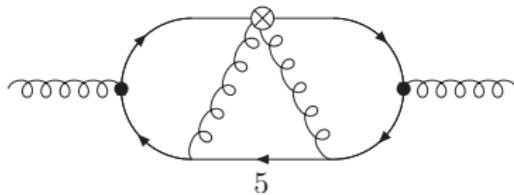

24 integral families are required and implemented in Reduze.

# Calculation of the master integrals

For the calculation of the master integrals we use a wide variety of tools:

- ▶ Hypergeometric functions.
- ▶ Summation methods based on difference fields, implemented in the Mathematica program **Sigma** [C. Schneider, 2005–].
  - ▶ Reduction of the sums to a small number of key sums.
  - ▶ Expansion the summands in  $\varepsilon$ .
  - ▶ Simplification by symbolic summation algorithms based on  $\Pi\Sigma$ -fields [Karr 1981 J. ACM, Schneider 2005–].
  - ▶ Harmonic sums, polylogarithms and their various generalizations are algebraically reduced using the package **HarmonicSums** [Ablinger 2010, 2013, Ablinger, Blümlein, Schneider 2011, 2013].
- ▶ Mellin-Barnes representations.
- ▶ In the case of **convergent** massive 3-loop Feynman integrals, they can be performed in terms of **Hyperlogarithms** [Generalization of a method by F. Brown, 2008, to non-vanishing masses and local operators].
- ▶ Systems of Differential Equations.
- ▶ Almkvist-Zeilberger Theorem as Integration Method.

# V-Topology

- ▶ Emergence of a new function class : **nested generalized cyclotomic sums, weighted with binomials and inverse binomials of the type  $\binom{2i}{i}$ .**
- ▶ At the side of the iterated integrals **many root-valued letters** appear (around 30).
- ▶ The scalar diagram exhibits terms growing like  $8^N, 4^N, 2^N, N \rightarrow \infty$ . The growth  $2^N$  survives in the scalar case. **The physical diagram is free of this divergence.**
- ▶ Asymptotic representations can be constructed analytically to arbitrary precision.
- ▶ Various special **new numbers** appear, the simplest of which is  $\pi$ , through which  $\zeta_2$  is no longer an elementary constant here.

## Emergence of new nested sums :

$$\begin{aligned} & \sum_{i=1}^N \binom{2i}{i} (-2)^i \sum_{j=1}^i \frac{1}{j \binom{2j}{j}} S_{1,2} \left( \frac{1}{2}, -1; j \right) \\ &= \int_0^1 dx \frac{x^N - 1}{x - 1} \sqrt{\frac{x}{8+x}} [H_{w_{17}, -1, 0}^*(x) - 2H_{w_{18}, -1, 0}^*(x)] \\ &+ \frac{\zeta_2}{2} \int_0^1 dx \frac{(-x)^N - 1}{x + 1} \sqrt{\frac{x}{8+x}} [H_{12}^*(x) - 2H_{13}^*(x)] \\ &+ c_3 \int_0^1 dx \frac{(-8x)^N - 1}{x + \frac{1}{8}} \sqrt{\frac{x}{1-x}}, \end{aligned}$$

---

$$\begin{aligned} w_{12} &= \frac{1}{\sqrt{x(8-x)}}, & w_{13} &= \frac{1}{(2-x)\sqrt{x(8-x)}}, \\ w_{17} &= \frac{1}{\sqrt{x(8+x)}}, & w_{18} &= \frac{1}{(2+x)\sqrt{x(8+x)}}. \end{aligned}$$

~ 100 associated independent nested sums. The associated iterated integrals request root-valued alphabets with about 30 new letters.

[J. Ablinger, J. Bümlein, J. Raab, C. Schneider, F. Wißbrock 2014.]

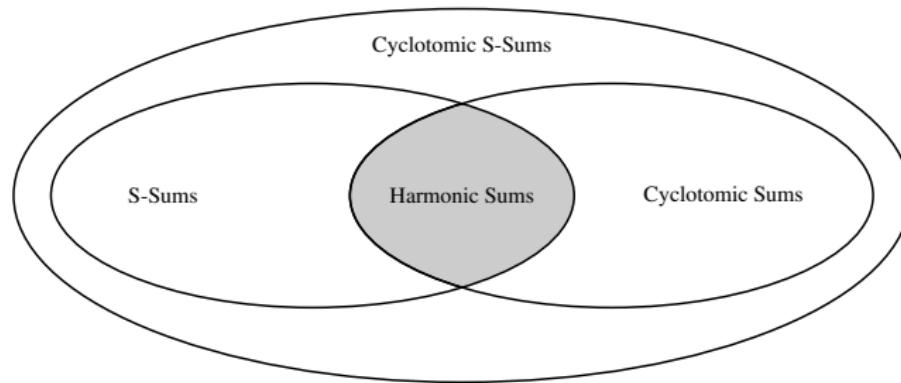

[J. Ablinger, J. Bümlein, J. Raab, C. Schneider 2014.]

Particle Physics Generates **NEW** Mathematics.

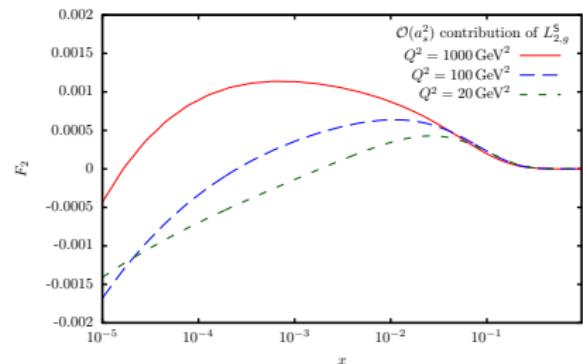

1

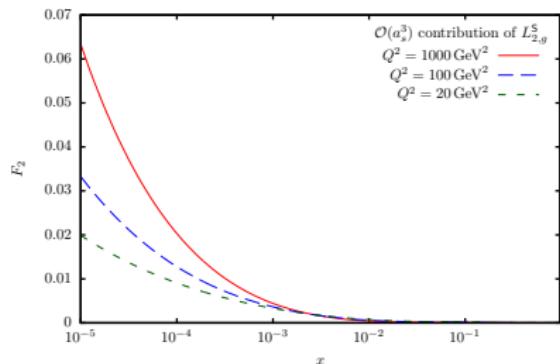

Nested (inverse) binomial sums .....

More and more onion skins to be added during these calculations.

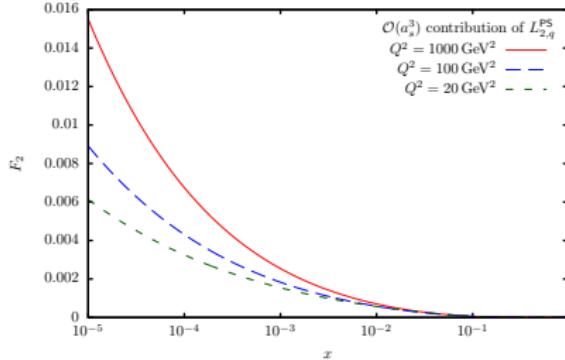

## Numerical Results : $L_{g,2}^S$ and $L_{q,2}^{PS}$

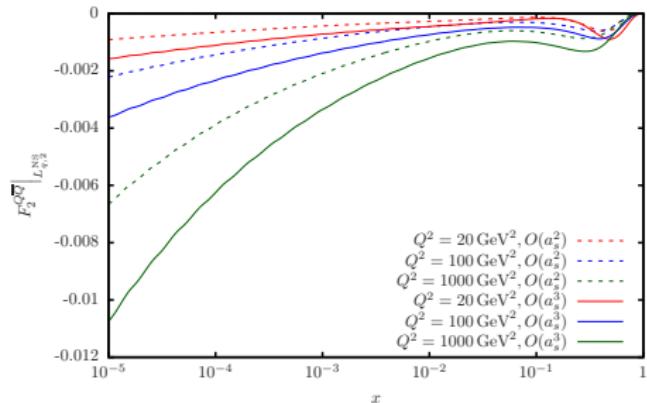

$$O(a_s^2) \quad L_{2,g}^S$$

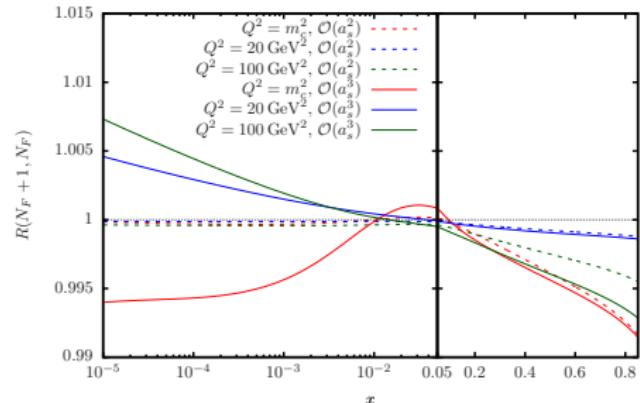

$$O(a_s^3) \quad L_{2,g}^S$$

$$L_{q,2}^{\text{PS}}$$

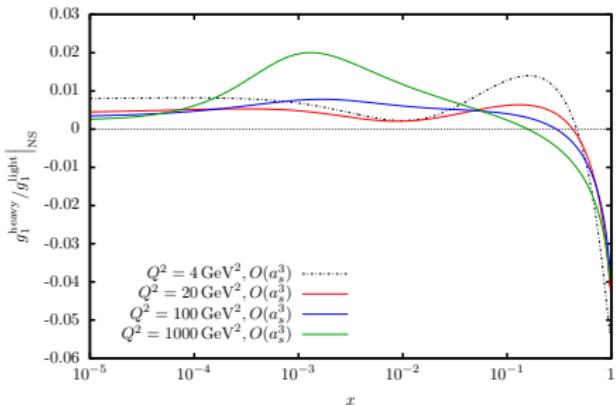

## Contribution to $F_2(x, Q^2)$

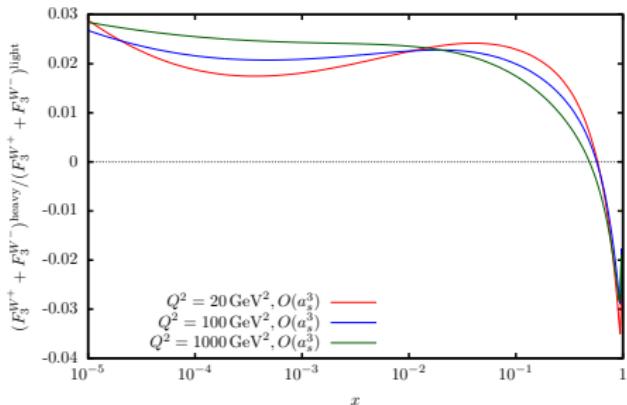

## VFNS matching

## NS corrections to $g_{1(2)}(x, Q^2)$ and $xF_3^{W^+ + W^-}$

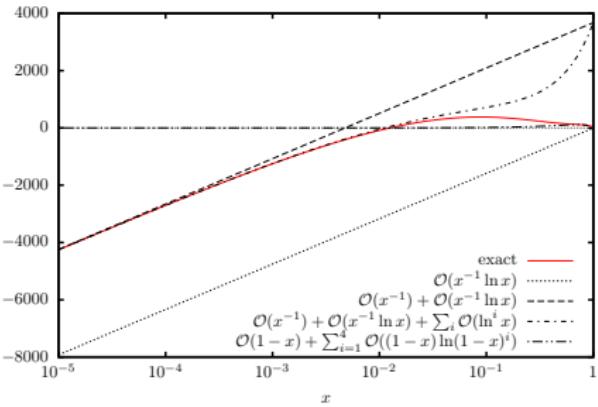

$$g_1(x, Q^2)$$

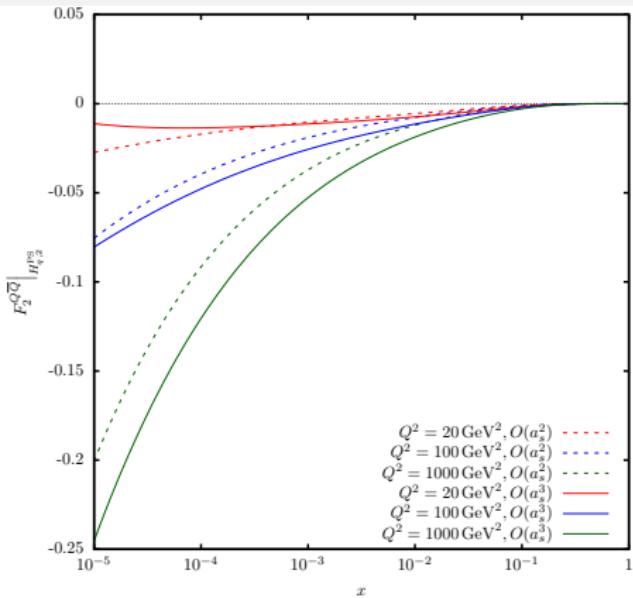

$$xF_3^{W^+ + W^-}(x, Q^2)$$

The corrections to  $g_2(x, Q^2)$  are obtained using the Wandzura-Wilczek relation.

$$H_{q,2}^{\text{PS}}$$

$$a_{Qq}^{(3),\text{PS}}$$

## Contribution to $F_2(x, Q^2)$

The leading small  $x$  approximation corresponding to CCH, 1991, departs from the physical result everywhere except for  $x = 1$ .

# 3-Loop OME: $A_{gg,Q}$

$$\begin{aligned}
a_{gg,Q}^{(3)} = & \frac{1 + (-1)^N}{2} \left\{ c_F^2 T_F \left[ \frac{16(N^2 + N + 2)}{N^2(N+1)^2} \sum_{i=1}^N \frac{\binom{2i}{i} \left( \sum_{j=1}^i \frac{4^j S_1(j-1)}{\binom{2j}{j} j^2} - 7\zeta_3 \right)}{4^i (i+1)^2} - \frac{4P_{69} S_1^2}{3(N-1)N^4(N+1)^4(N+2)} \right. \right. \\
& + \tilde{\gamma}_{gq}^{(0)} \left( \frac{128(S_{-4} - S_{-3}S_1 + S_{-3,1} + 2S_{-2,2})}{3N(N+1)(N+2)} + \frac{4(5N^2 + 5N - 22)S_1^2 S_2}{3N(N+1)(N+2)} + \dots \right) + \dots \Big] \\
& + c_A c_F T_F \left[ \frac{16P_{42}}{3(N-1)N^2(N+1)^2(N+2)} \sum_{i=1}^N \frac{\binom{2i}{i} \left( \sum_{j=1}^i \frac{4^j S_1(j-1)}{\binom{2j}{j} j^2} - 7\zeta_3 \right)}{4^i (i+1)^2} + \frac{32P_2 S_{-2,2}}{(N-1)N^2(N+1)^2(N+2)} \right. \\
& - \frac{64P_{14} S_{-2,1,1}}{3(N-1)N^2(N+1)^2(N+2)} - \frac{16P_{23} S_{-4}}{3(N-1)N^2(N+1)^2(N+2)} + \frac{4P_{63} S_4}{3(N-2)(N-1)N^2(N+1)^2(N+2)} + \dots \Big] \\
& + c_A^2 T_F \left[ - \frac{4P_{46}}{3(N-1)N^2(N+1)^2(N+2)} \sum_{i=1}^N \frac{\binom{2i}{i} \left( \sum_{j=1}^i \frac{4^j S_1(j-1)}{\binom{2j}{j} j^2} - 7\zeta_3 \right)}{4^i (i+1)^2} + \frac{256P_5 S_{-2,2}}{9(N-1)N^2(N+1)^2(N+2)} \right. \\
& + \frac{32P_{30} S_{-2,1,1} + 16P_{35} S_{-3,1} + 16P_{44} S_{-4}}{9(N-1)N^2(N+1)^2(N+2)} + \frac{16P_{52} S_{-2}^2}{27(N-1)N^2(N+1)^2(N+2)} + \frac{8P_{36} S_2^2}{9(N-1)N^2(N+1)^2} + \dots \Big] \\
& + c_F T_F^2 \left[ - \frac{16P_{48} \binom{2N}{N} 4^{-N} \left( \sum_{i=1}^N \frac{4^i S_1(i-1)}{\binom{2i}{i} i^2} - 7\zeta_3 \right)}{3(N-1)N(N+1)^2(N+2)(2N-3)(2N-1)} - \frac{32P_{86} S_1}{81(N-1)N^4(N+1)^4(N+2)(2N-3)(2N-1)} \right. \\
& + \frac{16P_{45} S_1^2}{27(N-1)N^3(N+1)^3(N+2)} - \frac{16P_{45} S_2}{9(N-1)N^3(N+1)^3(N+2)} + \dots \Big] + \dots \Big\} \quad (1)
\end{aligned}$$

Also, with this calculation we were able to rederive the three loop anomalous dimension  $\gamma_{gg}^{(3)}$  for the terms  $\propto T_F$ , and obtained

agreement with the literature.

# Moments for graphs with two massive lines ( $m_1 \neq m_2$ )

$$\begin{aligned}

\end{aligned}$$

→ q2e/exp [Harlander, Seidensticker, Steinhauser 1999]  $x = m_1^2/m_2^2$

Analytic general N results are available for  $A_{qq,Q}^{\text{NS}}$ ,  $A_{Qq}^{\text{PS}}$  and the scalar integrals of  $A_{gg,Q}$ .

# Conclusions

- ▶ 2009: 10-14 Mellin Moments for all massive 3-loop OMEs, WC.
- ▶ 2010: Wilson Coefficients  $L_q^{(3),\text{PS}}(N)$ ,  $L_g^{(3),\text{S}}(N)$ .
- ▶ 2013: Ladder, V-Graph and Benz-topologies for graphs, with no singularities in  $\varepsilon$  can be systematically calculated for **general  $N$** .
- ▶ Here **new functions** occur (including a larger number of root-letters in iterated integrals).
- ▶ 2014  $L_q^{\text{NS},(3)}$ ,  $A_{gq,Q}^{\text{S},(3)}$ ,  $A_{qq,Q}^{\text{NS,TR}(3)}$ ,  $H_{2,q}^{\text{PS}(3)}$  and  $A_{Qq}^{\text{PS}(3)}$  were completed.
- ▶ A method for the calculation of **graphs with two massive lines** of equal masses and operator insertions has been developed and applied  $A_{gg,Q}^{(3)}$ .
- ▶ The method can be generalized to the case of unequal masses. Here the moments for  $N = 2, 4, 6$  for all graphs with two quark lines of unequal masses are now known [ $\rightarrow$  extended renormalization]; for some OMEs the complete 2-mass structure has been computed.
- ▶ The  $O(\alpha_s^2)$  charged current Wilson coefficients have been completed.

# Conclusions

- ▶ The corresponding 3-loop anomalous dimensions were computed, those for **transversity** for the first time ab initio; those for the **PS-case** independently for the first time.
- ▶ All master integrals for  $A_{gg,Q}^{(3)}$  have been computed and  $A_{Qg}^{(3)}$  is underway. Here all the topologies, including the ladder- and V-topologies have been solved.
- ▶ Different new computer-algebra and mathematical technologies were developed.
