Light hadron spectrum and quark masses

Takashi Kaneko

High Energy Accelerator Research institute (KEK)

Introduction

study of light hadron spectrum:

- light hadron masses $\Rightarrow$ test of QCD
- determination of fundamental parameters of QCD; α_s, m_q

at lattice 2000:

in quenched QCD : matured

- ◦ low-lying hadron and quark masses are determined precisely … besides quenching effects

in $N_f = 2$ QCD : in progress

- ◦ systematic studies of sea quark effects

in $N_f = 3$ QCD : exploratory

- ◦ developing algorithm
- ◦ few studies

- results with KS action $\Rightarrow$ review by Toussaint
- flavor singlet $\Rightarrow$ review by Edwards
- Ginsparg-Wilson fermion $\Rightarrow$ review by Kikukawa

  $\Rightarrow$ review by Hernandez

- my talk : studies with Wilson-type action

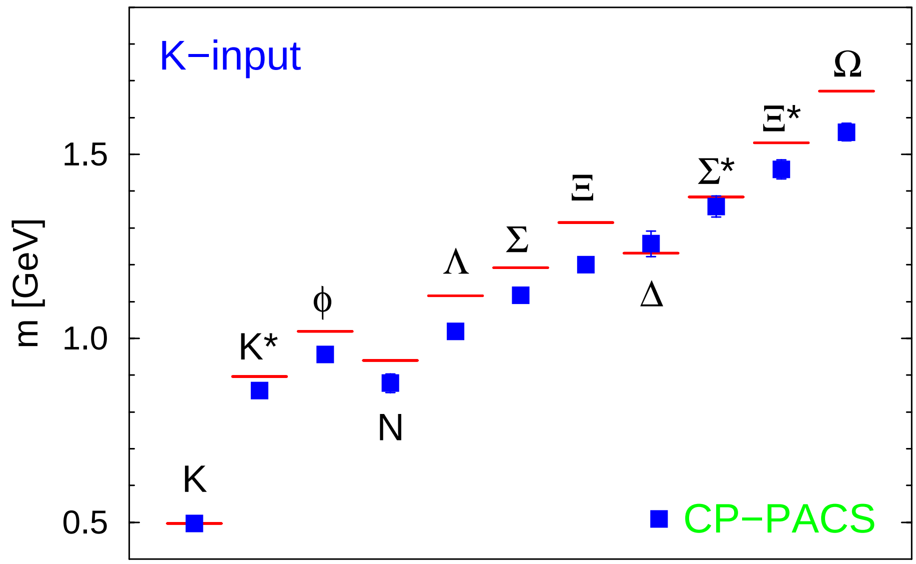
1. light hadron spectrum
   - in quenched QCD
   - in $N_f = 2$ full QCD

     search for sea quark effects
   - in $N_f = 3$ full QCD
2. test/application to chiral perturbation theory
3. determination of fundamental parameters of QCD
   - strong coupling
   - quark masses
4. summary

1. light hadron spectrum

— before lattice2000 —

ground states : **already** studied well!!



decay constants, quark masses: non-perturbatively determined

(ALPHA, APE, UKQCD, QCDSF...)

– this year –

1. testing ground for new formulations

- anisotropic
- Ginsparg-Wilson fermions (domain-wall, overlap)
- twisted mass QCD

for improvement

- non-perturbative improvement

2. study of heavier/excited states

- negative parity baryon

- calculation of meson spectrum

on anisotropic lattice

Matsufuru, *et al.*

plaq + clover (tadpole improved c_{SW}),

$a_s^{-1} =$ 1.1-2.0 GeV, $La \sim$ 2 fm, 200-100conf, $\xi = 4$

domain-wall fermion

RBC(Y.Aoki):

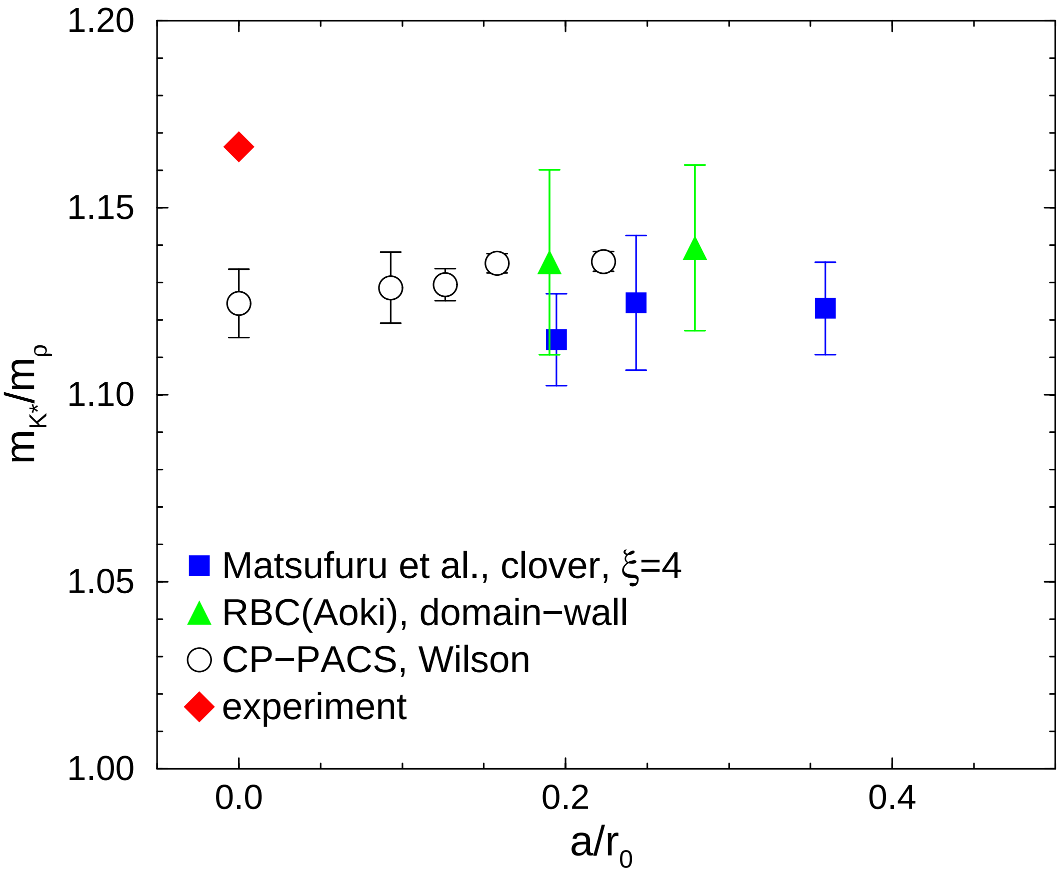
DBW2 gauge action(QCDTARO)

$(a^{-1}, L) \sim$ (1.3 GeV, 2.4 fm), (2.0 GeV, 1.6 fm),

$\sim$ 100 conf, $N_5 = 16$, $M_5 =$1.8

$\Rightarrow$ consistency with previous calculations using Wilson/KS.

m_{K^*}/m_ρ



- consistent with previous calculation with 2-3% accuracy
- confirm small $m_{K^*} - m_K$ in quenched QCD

- light quark masses with non-perturbative renomalization

Giusti, *et al.*:

$a^{-1} \sim 2$ GeV, $L \sim 1.4$ fm, 54 conf

Dong, *et al.*:

$a^{-1} \sim 1.2$ GeV, $L \sim 3.2$ fm, 63 conf

$\Rightarrow$ (see below)

◦ suppress exceptional conf at small quark masses

$$D_{\rm tmQCD} = D_{\rm Wilson} + i\mu_q\gamma_5\tau_3$$

$\Rightarrow$ lower bound for eigenvalues of $D_{\rm tmQCD}$

McNeile, *et al.*:

$a \sim$ 0.09 fm, L =1.4 fm

Della Morte, *et al.*:

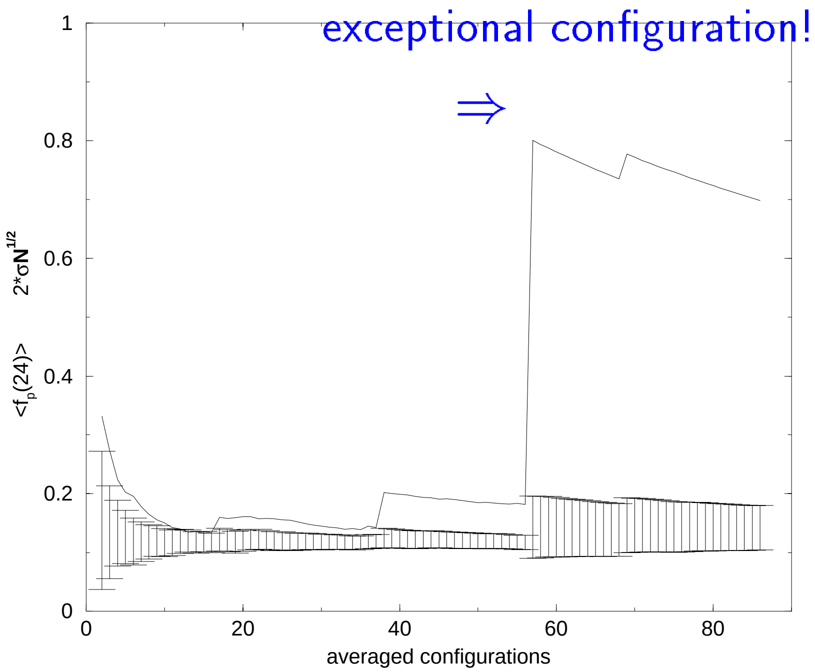
$a \sim$ 0.07,0.09 fm, L/a= 16, 24, T/L= 2,3,
$m_{\rm PS}/m_{\rm V} \geq 0.47$

plot $\sigma\sqrt{N_{\rm conf}}$ vs $N_{\rm conf}$ $\sigma =$ error of $\langle PP^\dagger\rangle$,

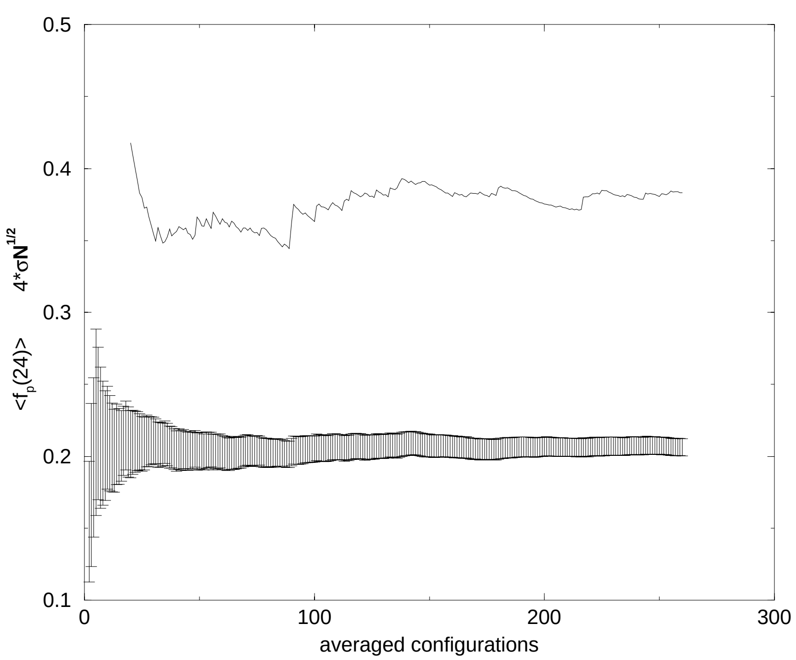
$\sigma \propto 1/\sqrt{N_{\rm conf}} \quad \Rightarrow \quad \sigma\sqrt{N_{\rm conf}} \sim$ const

$m_{\rm PS}/m_{\rm V} \sim 0.47$

2 $\sigma\sqrt{N}$ vs statistics in standard QCD



4 $\sigma\sqrt{N}$ vs statistics in twisted mass QCD



- exceptional configurations are suppressed in tm QCD.

- non-perturbative improvement

  ⇒ precise determination of hadron and quark masses

- at Lattice 2000

  c_A from Schrödinger functional(SF)

  c_A from Ward identity(WI)

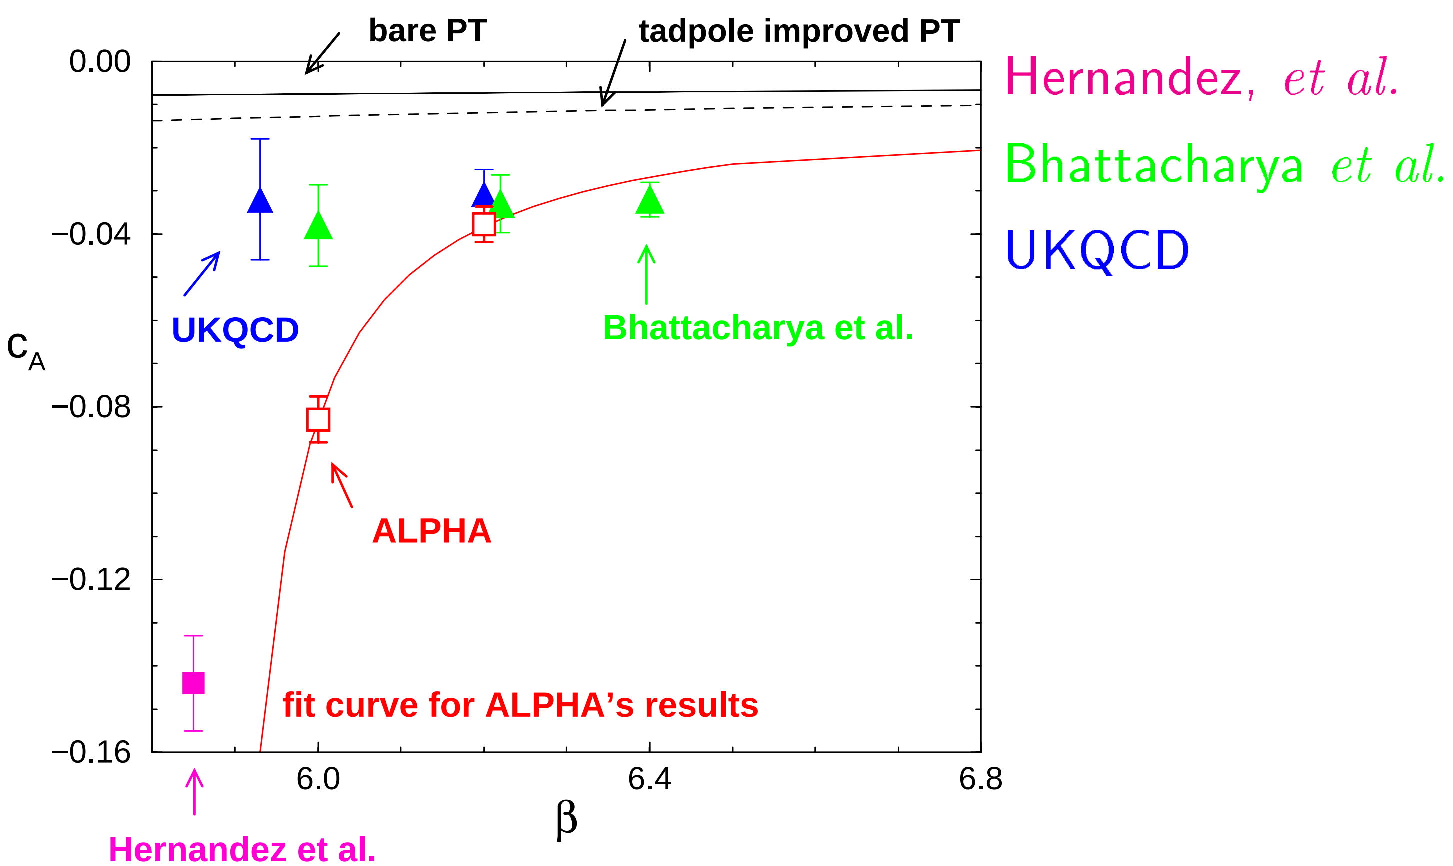
  ⇒ different values

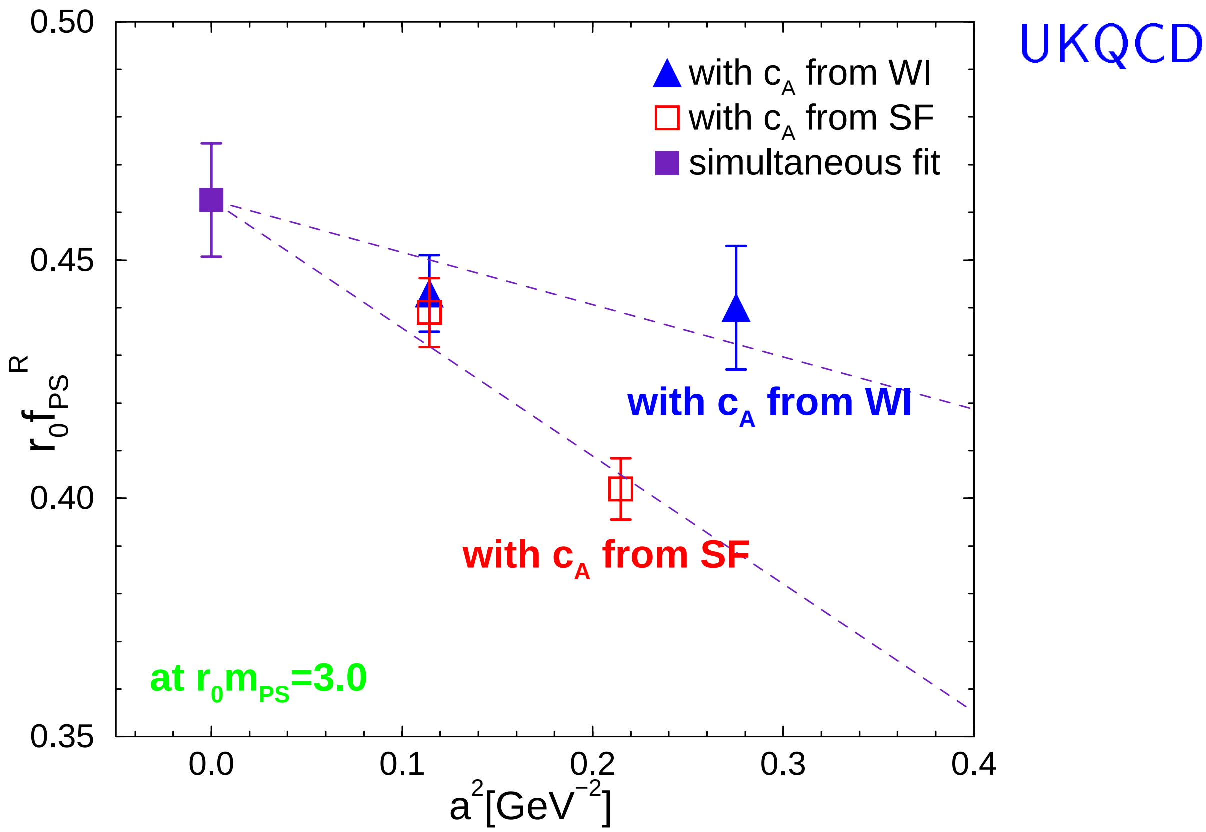
- new results for improvement coefficient c_A

Hernandez *et al.*: Schrödinger functional; at β=5.85

Bhattacharya *et al.*: Ward identity; at β=6.0, 6.2, 6.4

UKQCD(Collins): Ward identities; at β=5.93, 6.2





choice of improvement condition $\Rightarrow$ $O(a)$ difference in c_A

2.2.3 negative parity baryon N^*

excited baryons $\Leftarrow$ experimental study in Jefferson Laboratory

negative parity baryon

$$N^*, \;\; J^P = 1/2^-$$

$\Rightarrow$ parity mass splitting $N^* - N$

until Lattice 2000

Lee and Leinweber, LHPC, LHPC+UKQCD,...

- ∘ at large quark masses, or at fixed a
- ∘ finite size effects?

this year

- ∘ Sasaki *et al.*

  domain wall, $a^{-1} \sim 2$ GeV, $L = 1.6$ fm

- ∘ LHPC+QCDSF+UKQCD

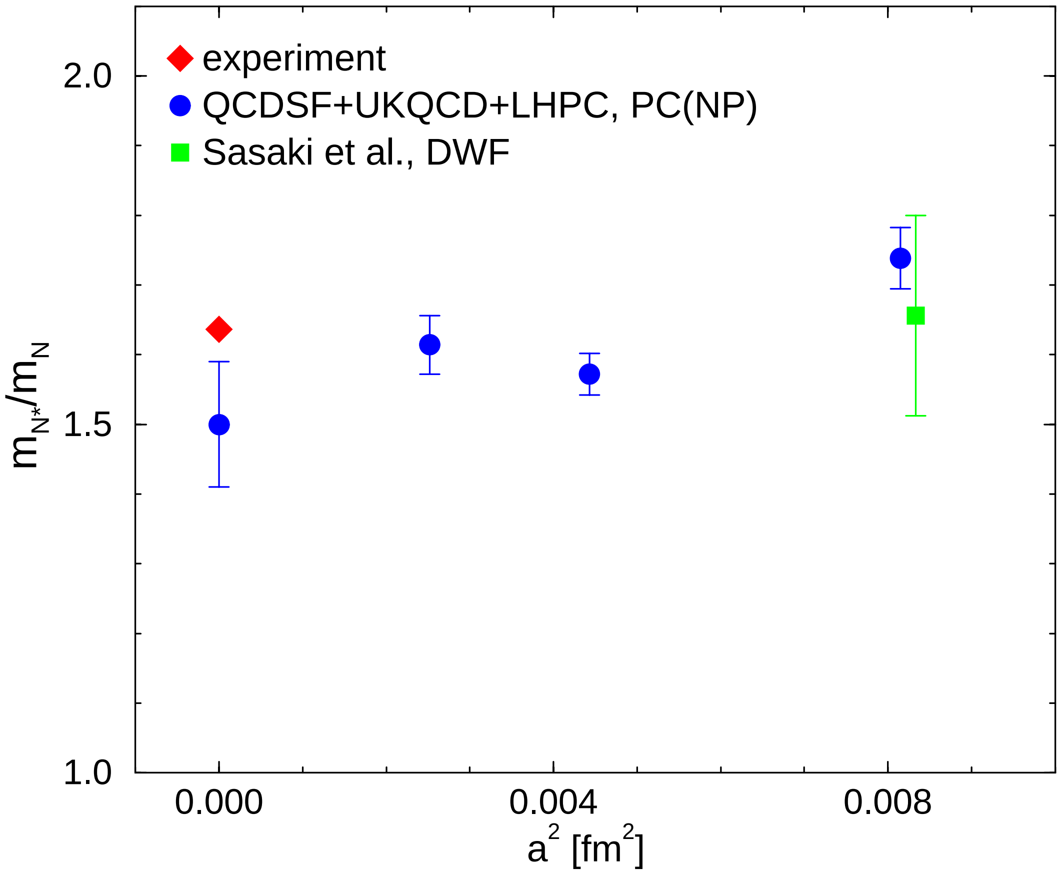
  systematic study of scaling violation, finite size effects

  clover(NP $c_{\rm SW}$), $a^{-1} \sim$ 2-4 GeV, $L =$ 1.5-2.2 fm

- ∘ Lee et al.

  anisotropic ($\xi = 3$), D_{234}, $a_t^{-1} \sim 2.5$ GeV, $L = 2.4$ fm

  chiral extrapolation has not been performed



- reproduce experimental N^* - N splitting within 10% accuracy.

- interesting to see other excitation
  - $N'(1440)$, $\Lambda(1405)$, ...

1.2 $N_f = 2$ QCD

recent studies in $N_f = 2$ full QCD

group	action	a_t[fm]	La_s[fm]	$m_{\rm PS}/m_{\rm V}$
SESAM	P-W	0.07	1.2	0.69-0.83
TχL	P-W	0.07	1.8	0.55,0.7
SESAM/TχL	P-W	0.09	1.4	0.68-0.85
GRAL	P-W	0.12	1.9	0.4
UKQCD	P-C(1.76)	0.12	0.98-1.9	0.67-0.86
UKQCD	P-C(NP)	0.10	1.6	0.69-0.83
QCDSF	P-C(NP)	0.09	2.4,1.6	0.69,0.76
JLQCD	P-C(NP)	0.09	1.0-1.7	0.60-0.80
CP-PACS	R-C(TP)	0.11-0.22	2.5-2.6	0.55-0.81
Columbia	P-KS	0.09	1.5	0.57-0.70
MILC	P-KS	0.11-0.3	2.4-3.7	0.3-0.8
Columbia	PKS($\xi \neq 1$)	0.06-0.19	3.2-5.4	0.3-0.8
MILC	Sy-imp.KS	0.13	2.6	0.50

results with staggered fermion $\Rightarrow$ review by Toussaint.

results with Wilson fermion $\Rightarrow$ this talk.

Columbia(Levkova) : anisotropic lattices $\rightarrow$ phase transition.

GRAL(Orth) : beyond $\rho \rightarrow \pi\pi$ threshold.

SESAM/TχL(Eicker) : light quark masses.

UKQCD+QCDSF(Schierholz) : strong coupling

• the main issue

search for sea quark effects

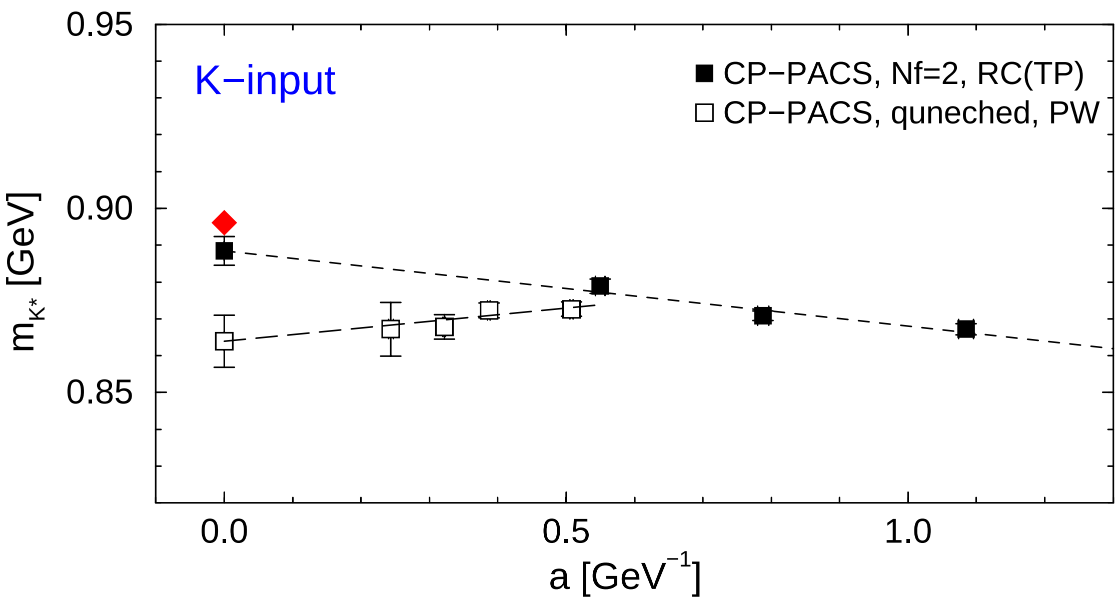
small hyperfine splitting in quenched QCD

$\Rightarrow$ closer to experiment in $N_f = 2$ QCD?

SESAM/TχL, UKQCD, CP-PACS, QCDSF, JLQCD, MILC, ...

at Lattice 2000 (review by S.Aoki)

CP-PACS



$\Rightarrow$ Vector meson masses are closer to experiment

$\Rightarrow$ But after continuum extrapolation

UKQCD

- clover, non-perturbative c_{SW}
- fixed a/r_0 (a ~0.1 fm)
- $L \sim$ 1.6 fm
- $m_{\mathrm{PS}}/m_{\mathrm{V}} \geq$ 0.7

JLQCD

- clover, non-perturbative c_{SW}
- fixed β ($a \sim$ 0.1 fm at physical $m_{q,\mathrm{sea}}$)
- $L \sim$ 1.1, 1.4, 1.8 fm ($\Rightarrow$ finite size effect)
- $m_{\mathrm{PS}}/m_{\mathrm{V}} \geq$ 0.6

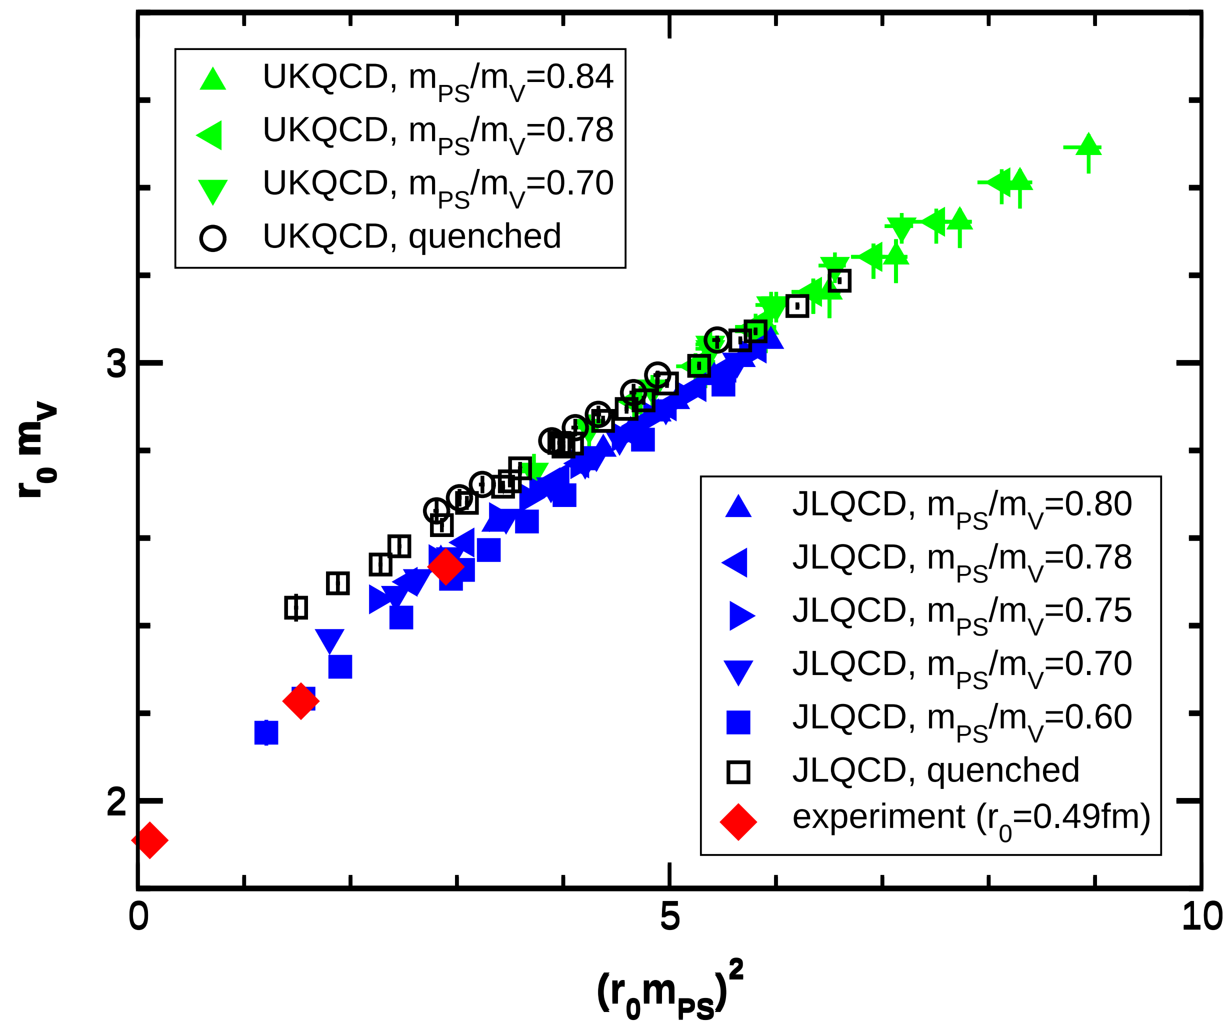
- UKQCD, JLQCD : leading scaling violation $O(a^2)$

  $\Rightarrow$ smaller scaling violation compared to CP-PACS

  CP-PACS : RG gauge + tadpole improved clover

- should provide an interesting check of sea quark effects.

meson masses at simulation points

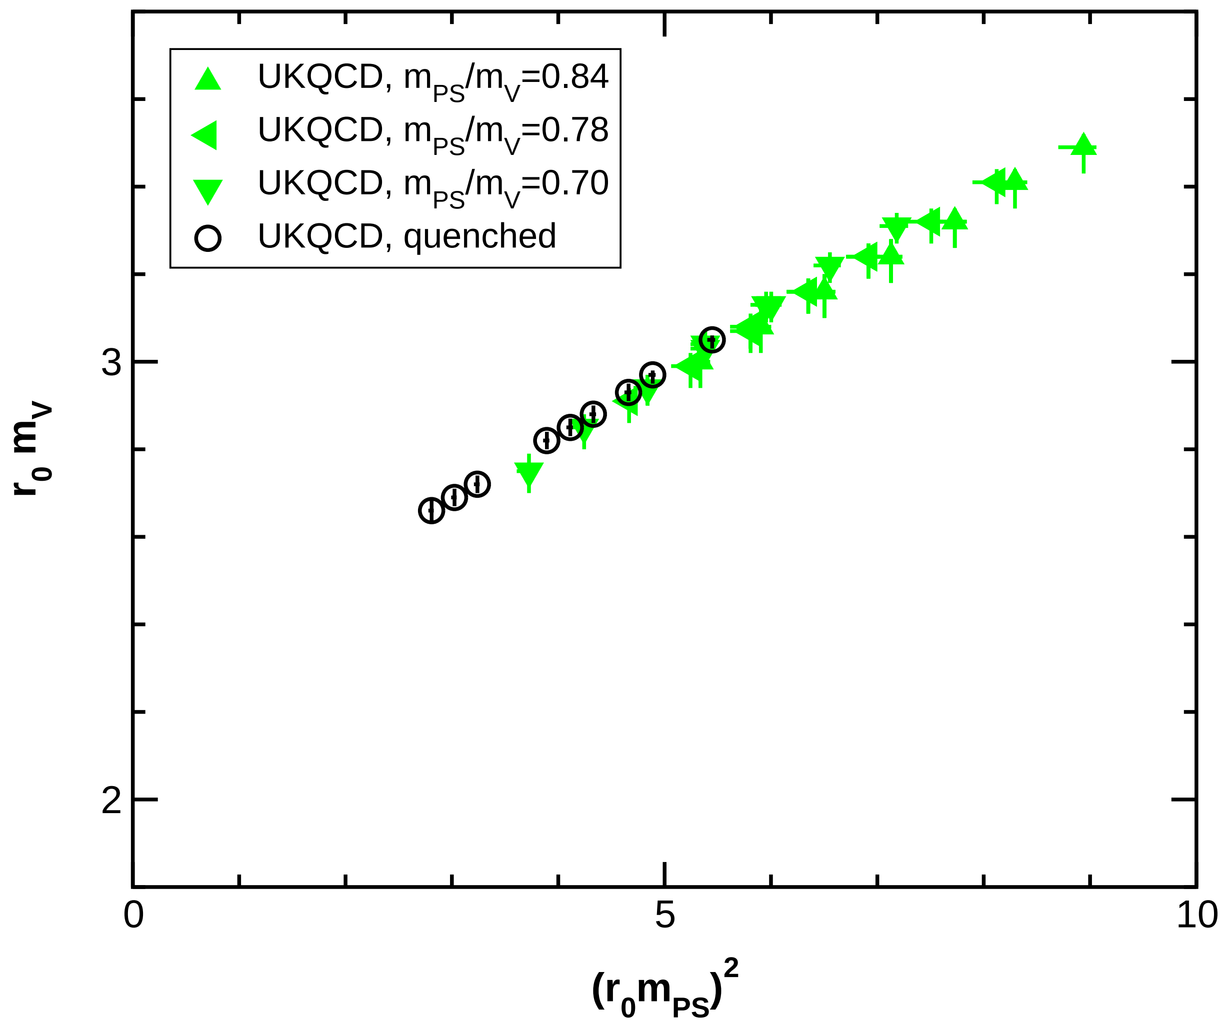


- UKQCD
  - $m_{\rm PS}/m_{\rm V} \geq 0.7$
  - sea quark effect is not clear from this plot.
- JLQCD

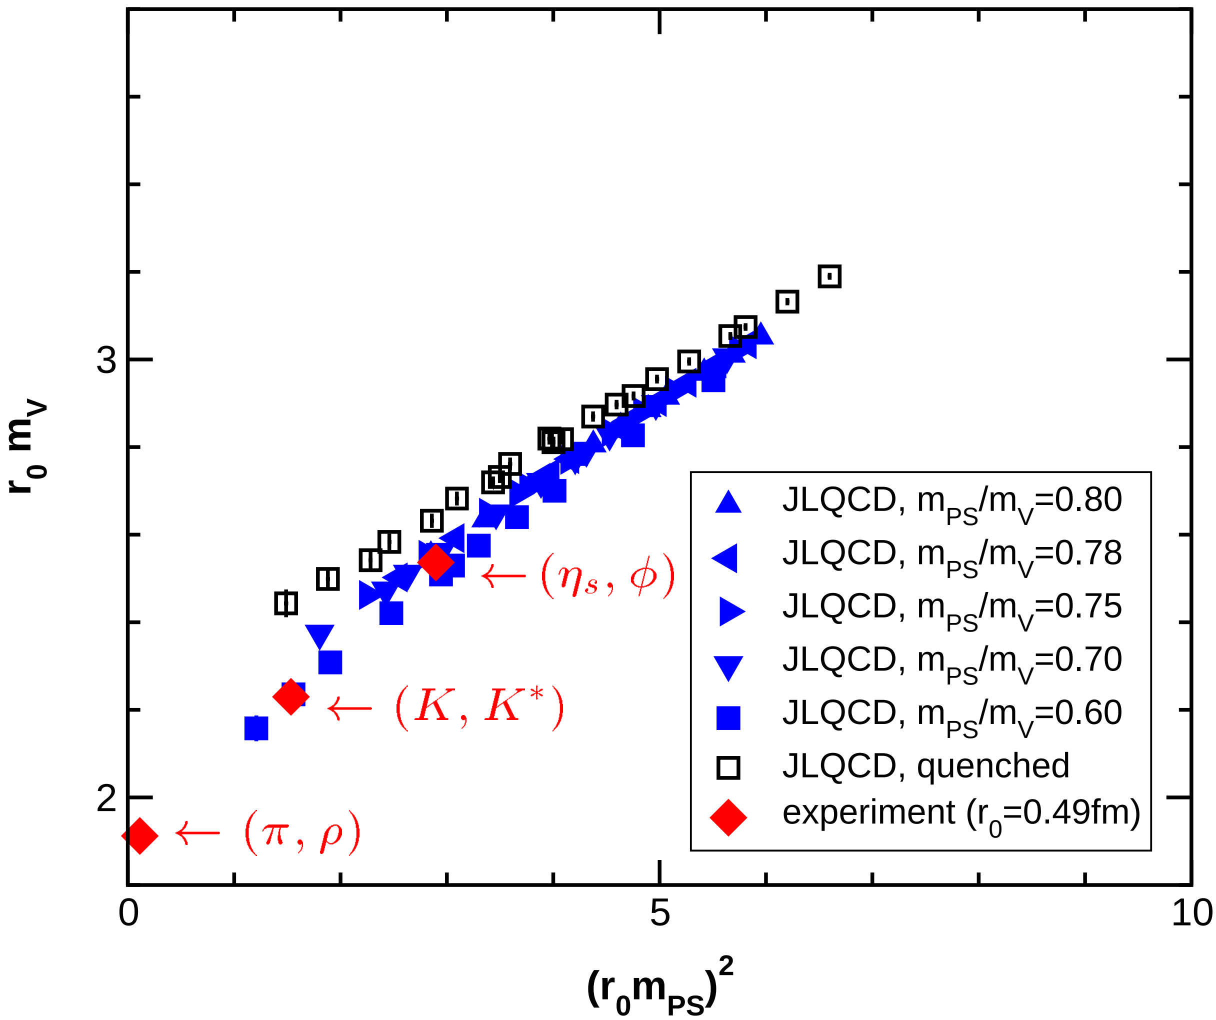
  clear sea quark effects

  larger slope $\Rightarrow$ larger hyperfine splitting

meson masses at simulation points



- UKQCD
  - $m_{\rm PS}/m_{\rm V} \geq 0.7$
  - sea quark effect is not clear from this plot.



- JLQCD
  - $m_{\mathrm{PS}}/m_{\mathrm{V}} \geq 0.6$
  - clear sea quark effect

larger slope $\Rightarrow$ larger hyperfine splitting

$$m_{\rm V} \frac{dm_{\rm V}}{dm_{\rm PS}^2} \quad @ \quad \frac{m_{\rm V}}{m_{\rm PS}} = \frac{m_{K^*}}{m_K}$$

(Lacock and Michael)

- monitor the slope of "$m_{\rm V}$ vs $m_{\rm PS}^2$" plot

in full QCD

1) calculate J at fixed sea quark masses, and take $m_{\rm sea} \to m_{ud}$

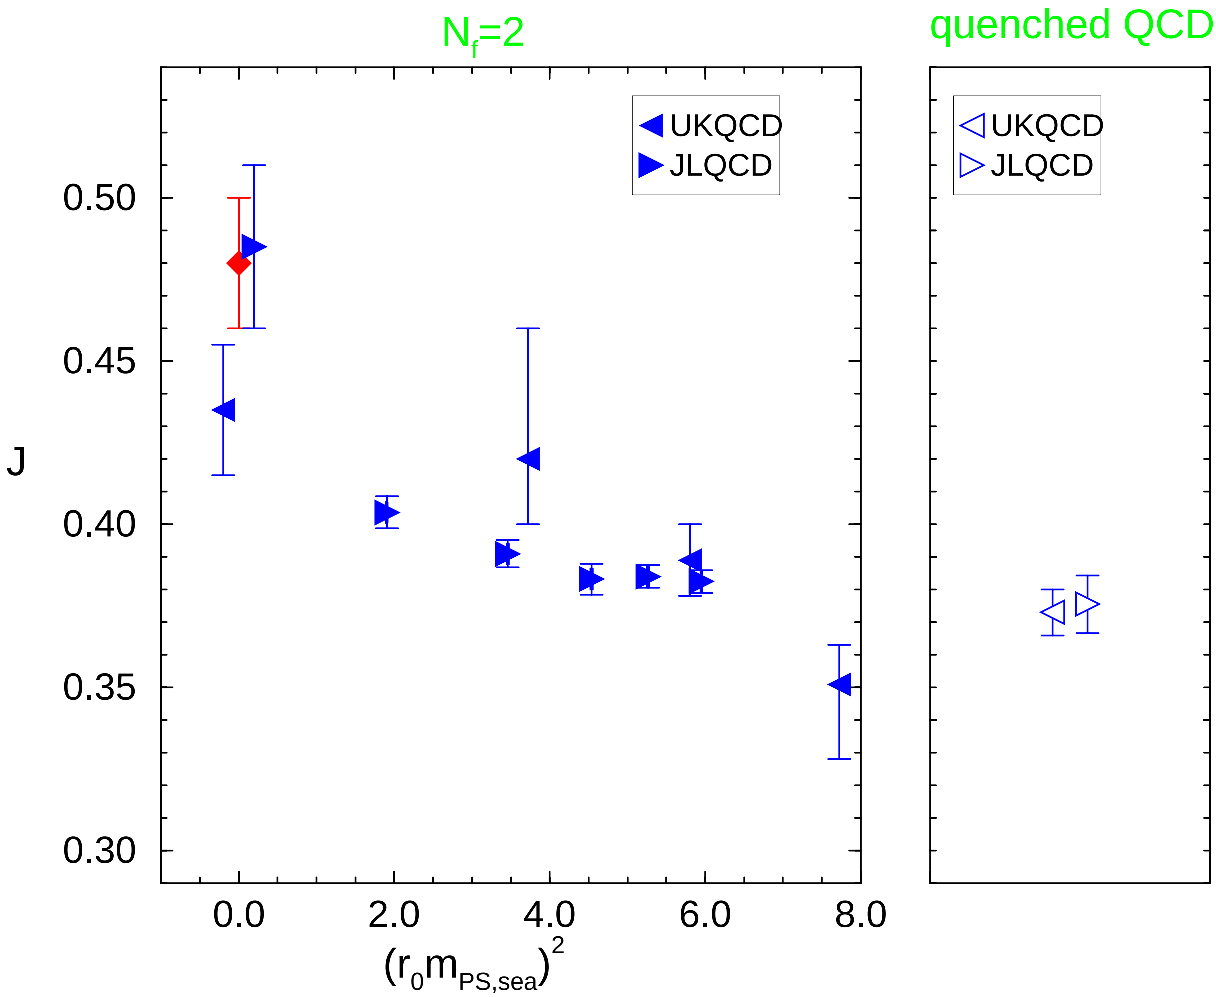
$$J \equiv \lim_{m_{\rm sea} \to m_{ud}} J(m_{\rm sea}), \quad J(m_{\rm sea}) \equiv m_{\rm V} \frac{dm_{\rm V}}{dm_{\rm PS}^2}\bigg|_{m_{\rm sea}}$$

2) calculate J from meson masses at physical quark mass

$$J \equiv m_{K^*} \frac{m_{K^*} - m_\rho}{m_K^2 - m_\pi^2}$$

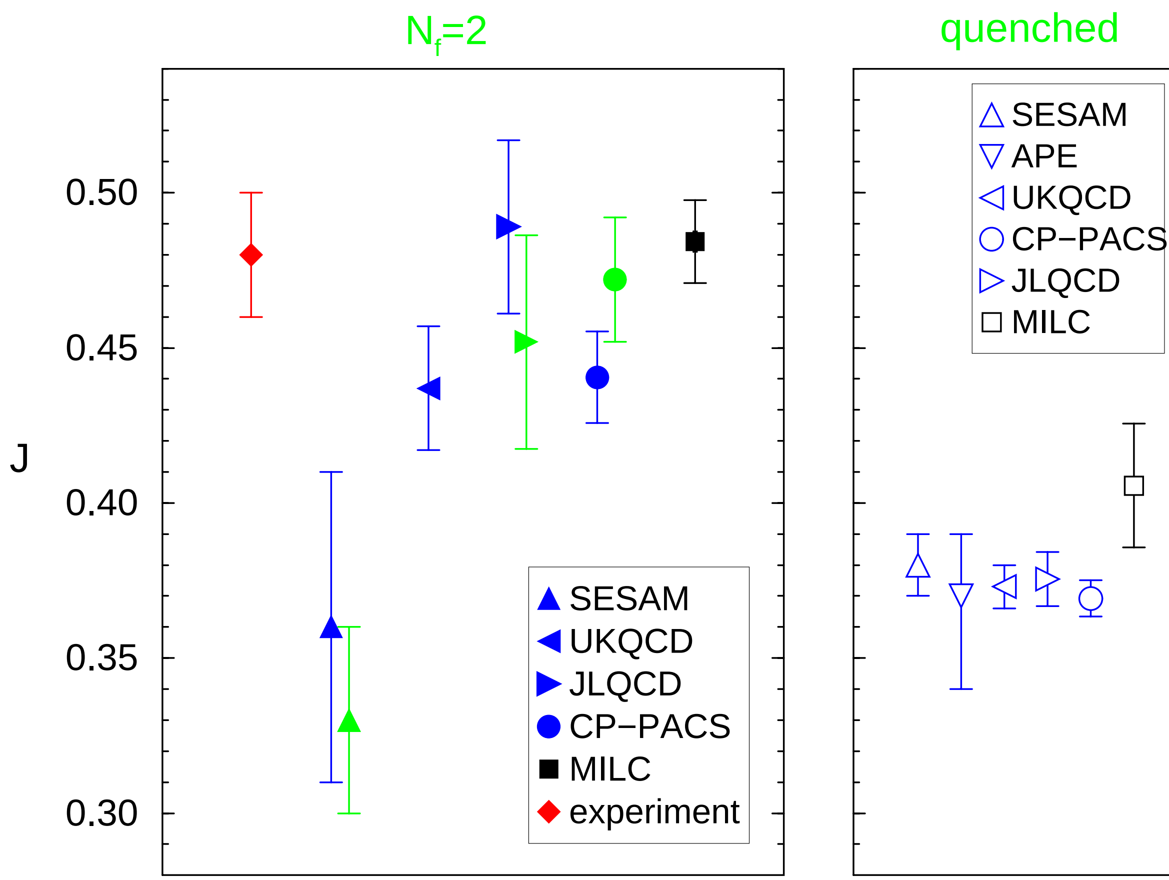
3) calculate J as mass ratio at simulation point(MILC)

$$J \equiv m_{\rm V}(m_1, m_2) \frac{m_{\rm V}(m_2, m_2) - m_{\rm V}(m_1, m_1)}{2\,(m_{\rm PS}(m_1, m_2)^2 - m_{\rm PS}(m_1, m_1)^2)}$$



1) J at fixed sea quark masses, and take $m_{\rm sea} \to m_{ud}$

- J increases as sea quark mass decreases



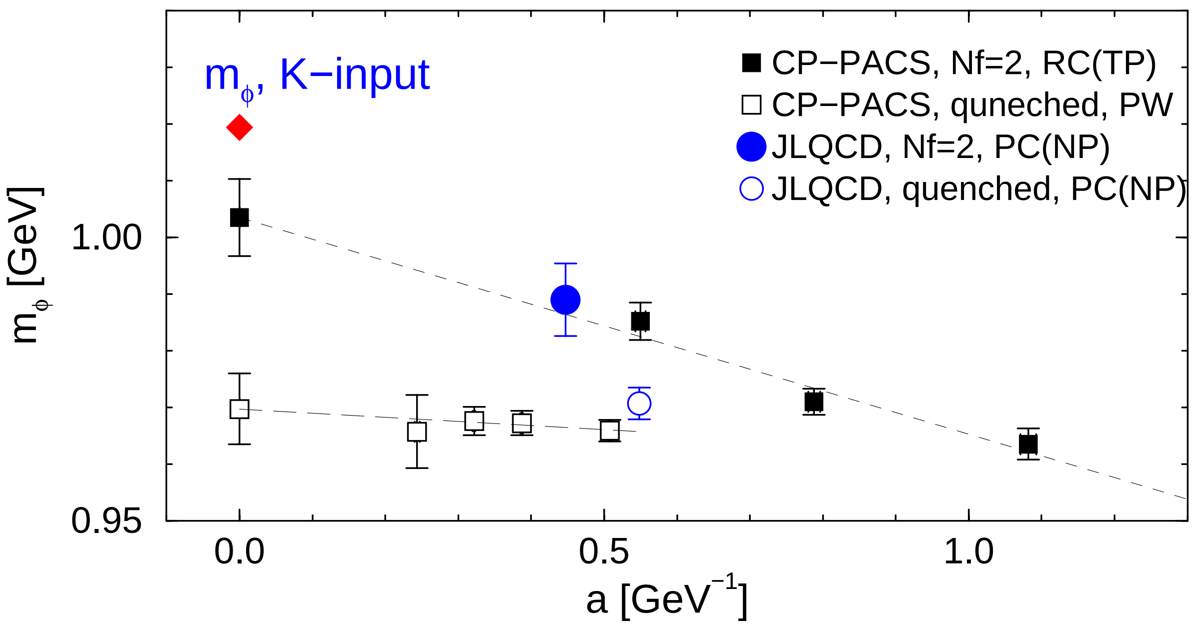
1) J at fixed sea quark masses, and take $m_{\rm sea} \to m_{ud}$

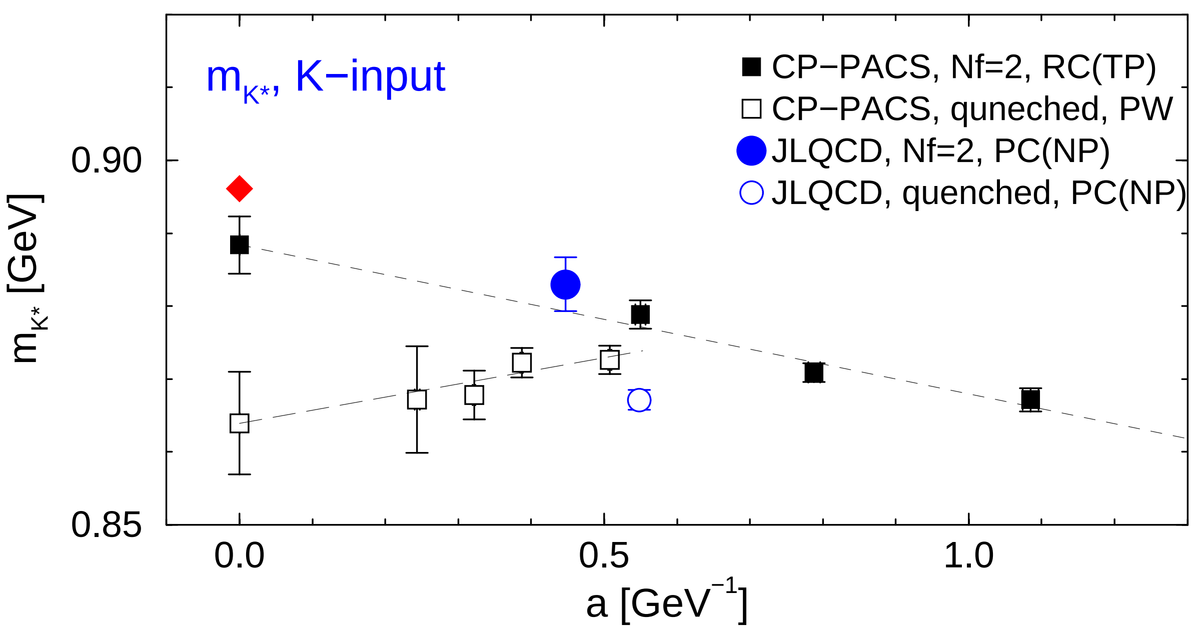
2) J from meson masses at physical quark mass

3) J as mass ratio at simulation point(MILC)

- sea quark effects $\Rightarrow$ **closer to experiment**

  except SESAM $\Leftarrow$ heavy sea quark mass $(m_{\rm PS}/m_{\rm V} \geq 0.69)$?





- sea quark effect is confirmed using different action

JLQCD: plaq + clover(non-perturbative c_{SW})

CP-PACS: RG + clover(tadpole improved c_{SW})

- recent studies of baryon spectrum

CP-PACS : $V \sim 2.5$ fm.

UKQCD : $V \sim 1.6$ fm.

JLQCD : $V \sim 1.1$ - 1.8 fm.

These volumes are sufficiently large?

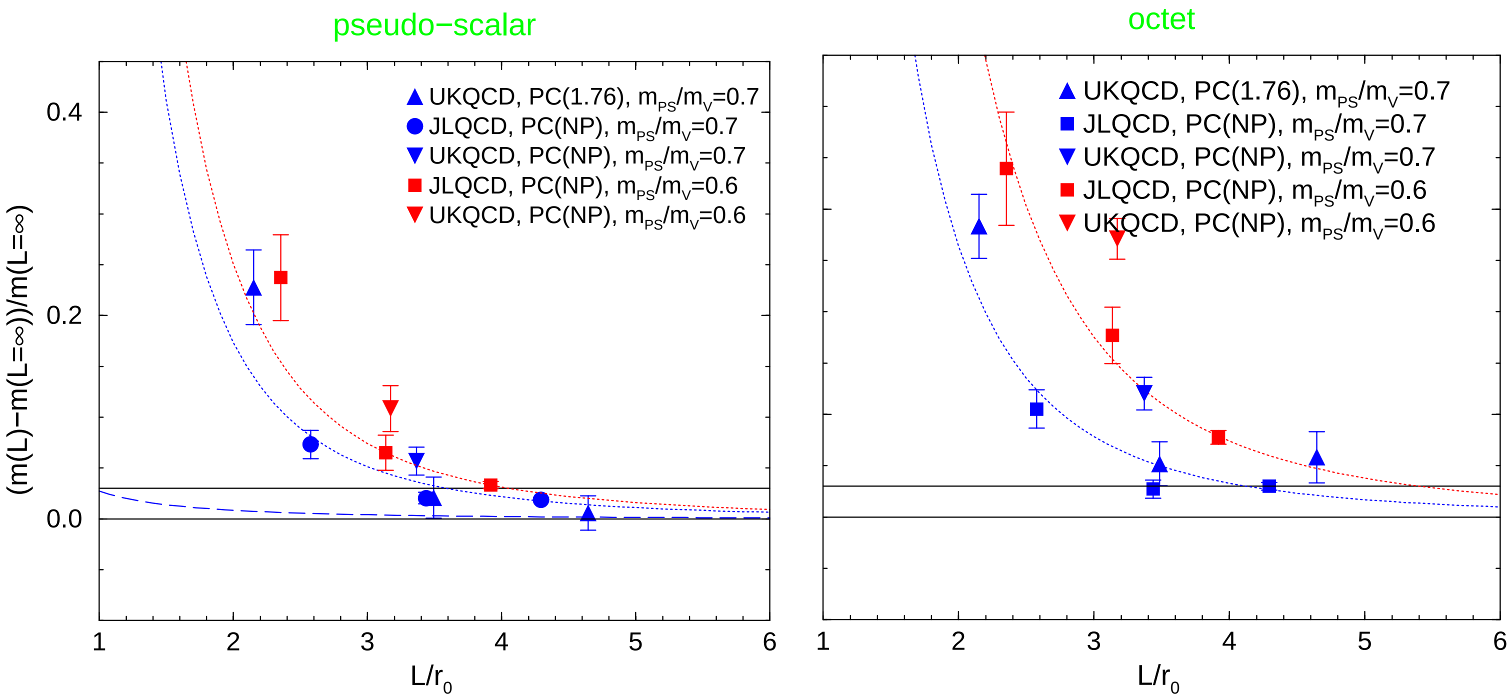
$\Rightarrow$ check finite size effects in JLQCD and UKQCD data

- mass shift at finite volume

$(m(L) - m(\infty))/m(\infty)$ vs L/r_0

blue symbols : at $m_{\rm PS}/m_{\rm V}$=0.7

red symbols : at $m_{\rm PS}/m_{\rm V}$=0.6



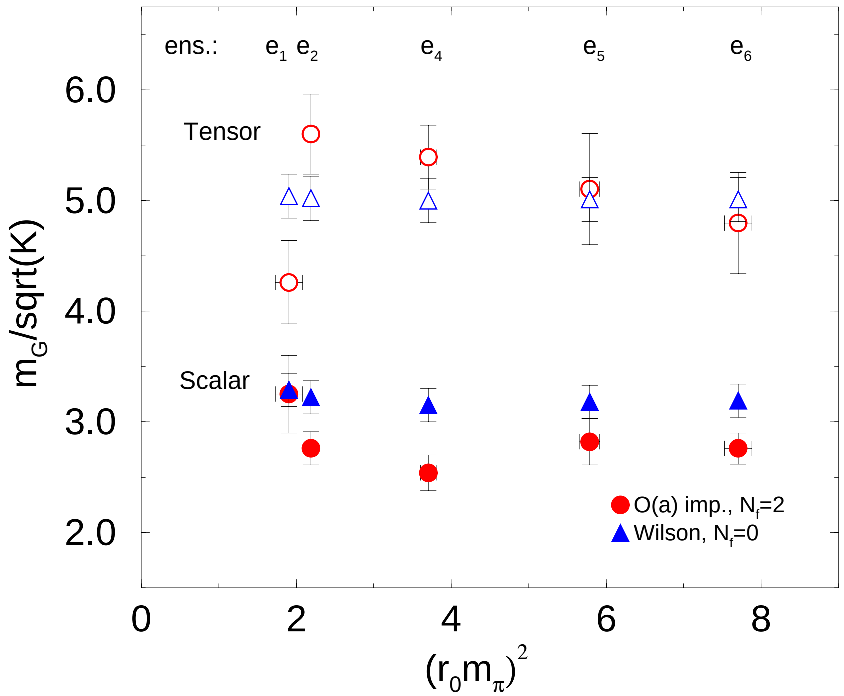
- volume for FSE $\leq$ 3%, at a=0.1 fm

	$m_{\rm PS}/m_{\rm V}\sim$0.7	$m_{\rm PS}/m_{\rm V}\sim$0.6
meson	16^3	20^3
baryon	24^3	32^3

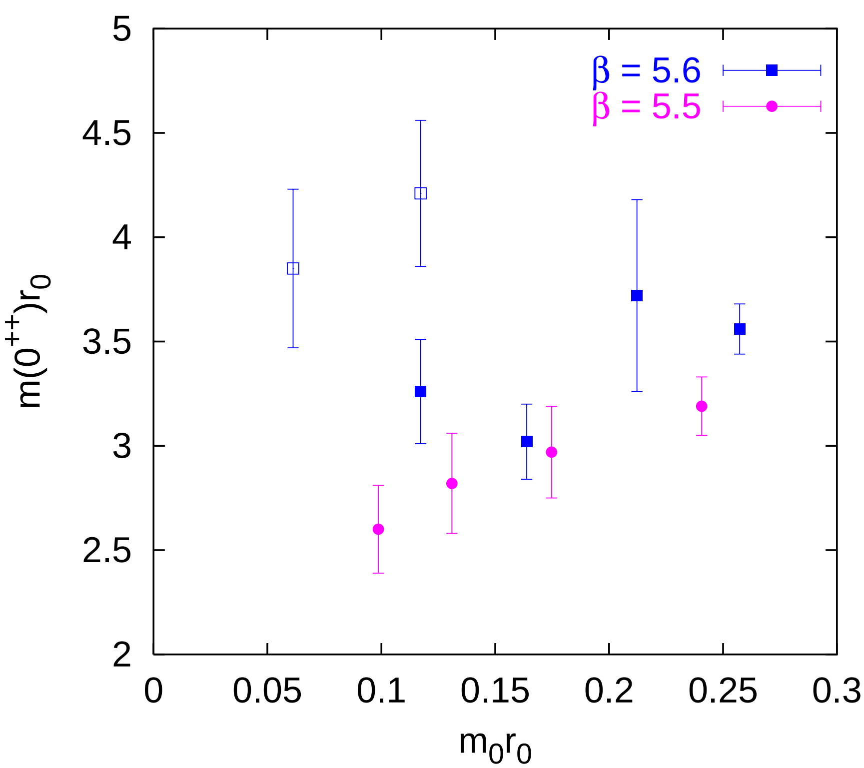
◦ much larger volumes are required for baryons!

◦ still, we haven't obtained definite conclusions

UKQCD : $\sim$ 15% decrease in 0^{++} at $a^{-1} \sim 2$ GeV



SESAM : $\sim$ 25% decrease in 0^{++} at $a^{-1} \sim 2.7$ GeV



- decreases in 0^{++} $\Rightarrow$ indication of sea quark effects?
- need more precise data and study of scaling violation.

SCALAR collaboration (Nakamura)

- calculation of scalar meson in $N_f = 2$ full QCD

  Wilson fermion, a =0.2 fm, $m_{\rm PS}/m_{\rm V}$ =0.9

  $\Rightarrow$ poster by Nakamura

1.3 $N_f = 3$ QCD

this year

- with KS fermion

MILC

- improved KS
- standard hybrid-R

- with Wilson-type action

algorithm for odd number of flavors $\Rightarrow$ review by Peardon

exact algorithms have been developed.

- multi-boson (Lüscher, Borici and de Forcrand, Alexandrou *et al.*)
- polynomial HMC (Takaishi and Forcrand)

Gebert *et al.*

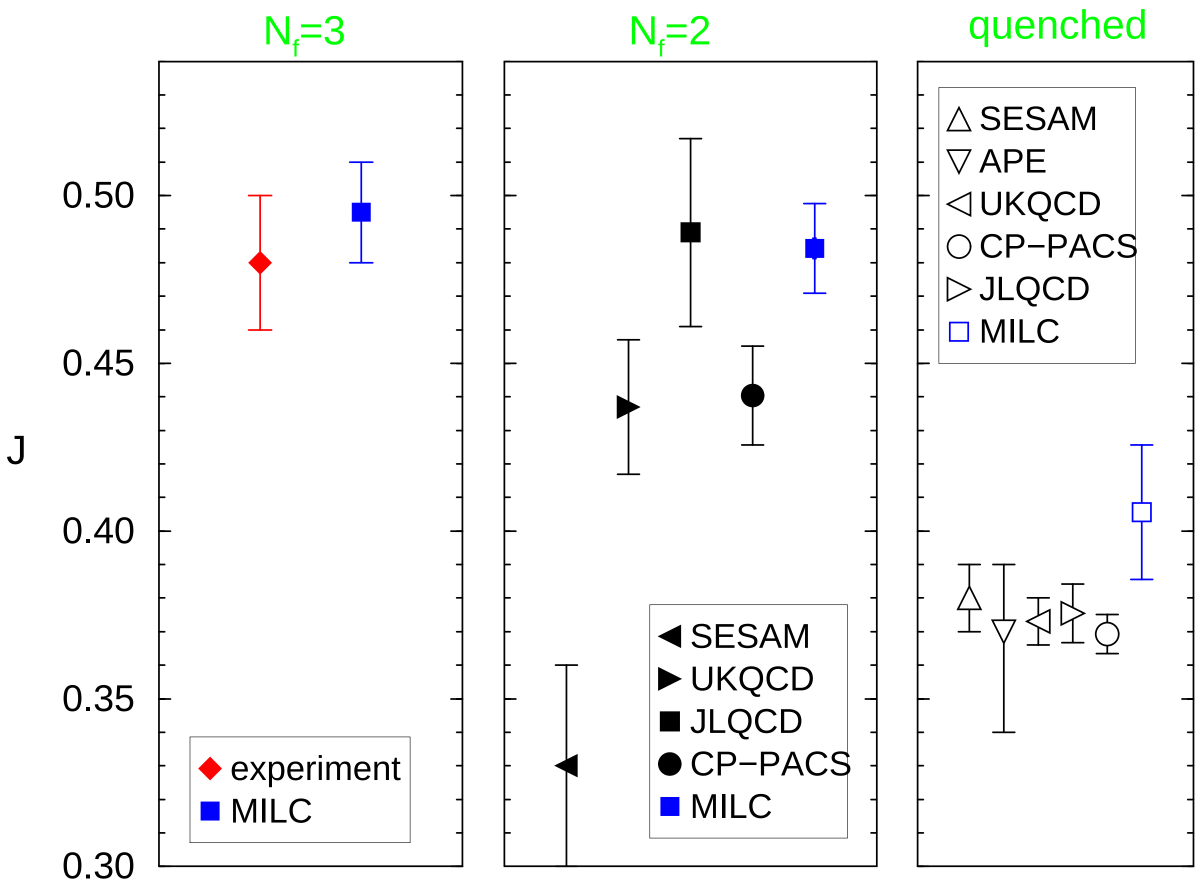
- plaquette gauge + Wilson
- two-step multi-boson (Montvay)

JLQCD

- plaquette gauge + clover
- polynomial HMC (Ishikawa(JLQCD))

MILC ($\Rightarrow$ review by Toussaint)

J parameter:

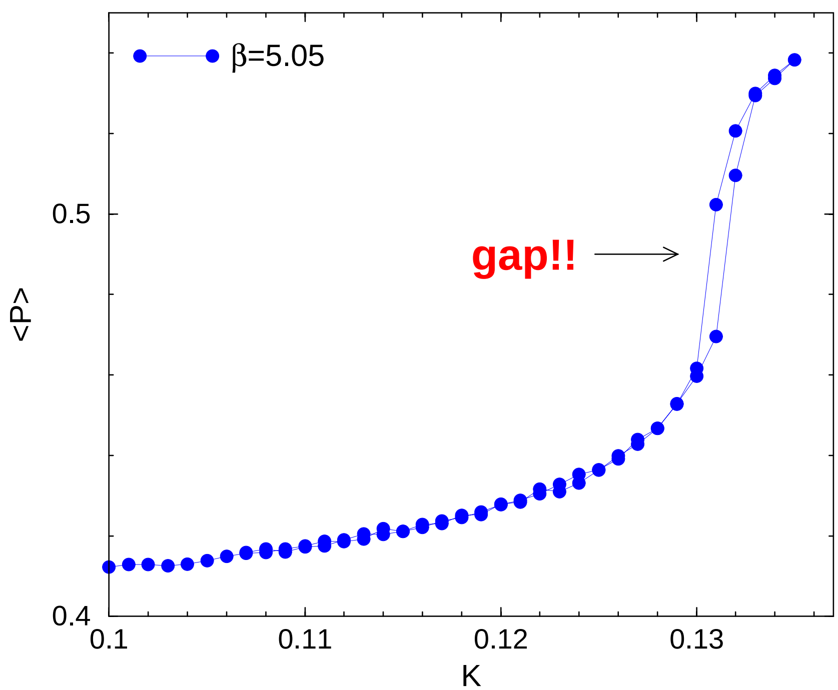


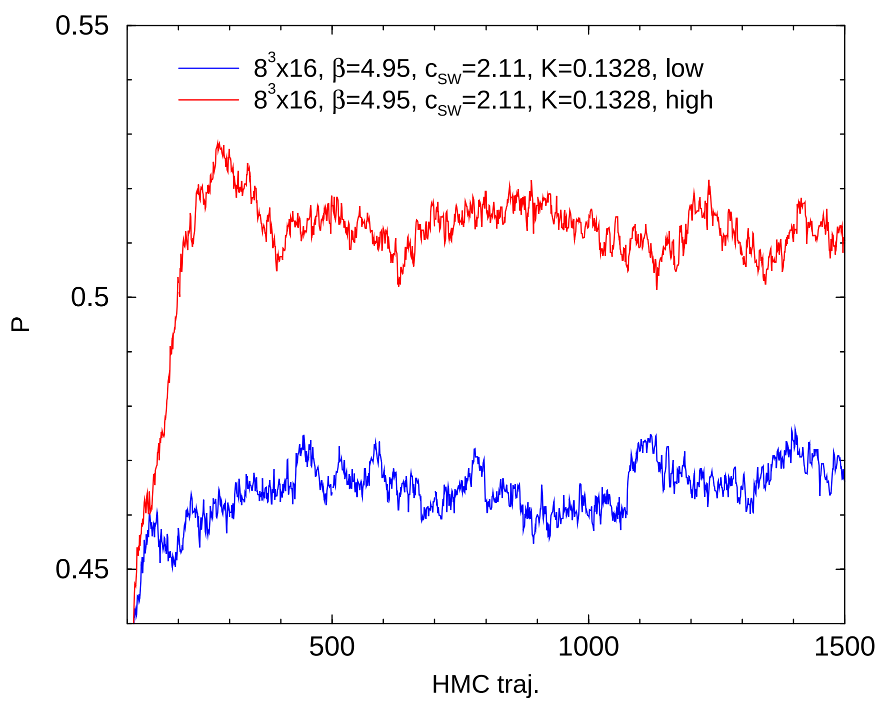
- MILC's results
  - clear sea quark effects
  - consistent with experiment in full QCD
- no systematic deviation between KS and Wilson/clover

JLQCD(Okawa)

- first systematic simulations with $O(a)$ improved Wilson action
  degenerated 3 flavors, tadpole improved $c_{\rm SW}$
  study of phase structure $\Rightarrow$ study of light hadron spectrum

- unexpected phase transition is found!!





$8^3 \times 16,\ \beta=4.95$

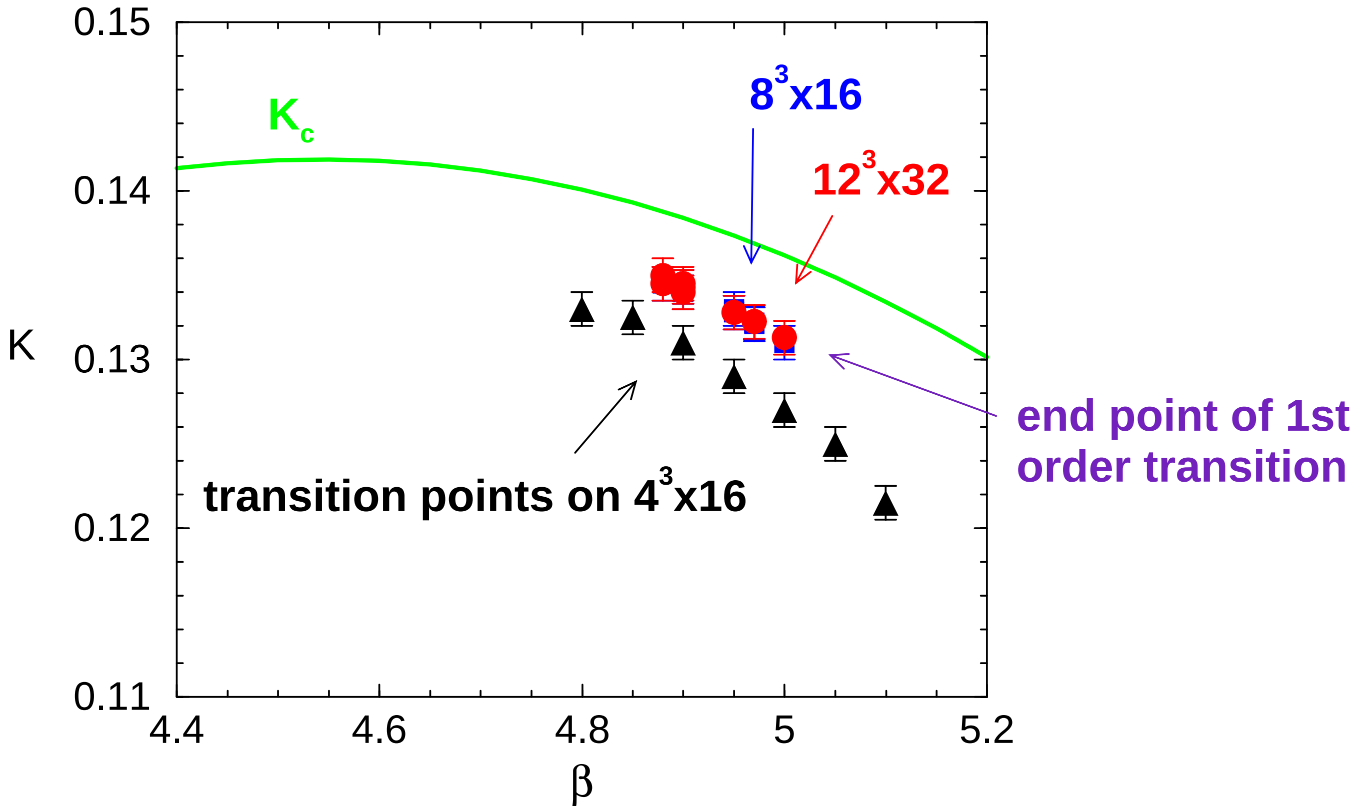
$K_{ud}=K_s=0.1328$

$a^{-1}=1.393(13)$ GeV

$m_{\rm PS}/m_{\rm V}=0.87$

$a^{-1}=0.827(4)$ GeV

$m_{\rm PS}/m_{\rm V}=0.86$



- bulk transition at $T = 0$. $\Rightarrow$ disappears at $\beta \sim$ 5.0

  $a^{-1} \sim$ 2.6 GeV at the end point

- this phase transition = lattice artifact
  - plaquette gauge + clover quarks $\Rightarrow$ a^{-1}>2.6 GeV.

- phase transition disappears for
  - improved gauge + clover quark
  - plaquette/improved gauge + Wilson quark

- with improved gauge and/or Wilson quark

  $\Rightarrow$ coarse lattices are OK!

2. test/application of ChPT

2. test/application of ChPT

- test of ChPT using lattice data
  - simulated quark masses $\gg m_{ud}$

    $\Rightarrow$ ChPT is used as a guide for extrapolation to m_{ud}
  - tests of ChPT at simulated quark mass: important!

    $\Leftarrow$ fit lattice data ($m_{\rm PS}$ and $f_{\rm PS}$) to ChPT formulae.

- determination of low-energy constants α_i (i=1-10)

  (recent work by Sharpe and Shoresh)

  - fit lattice data to ChPT formulae

    $\Rightarrow$ low-energy constants

    $\Rightarrow$ information on physics in real world from ChPT

  - $m_u = 0$? (Cohen, Kaplan and Nelson)

    phenomenological value : "standard" $\alpha_8 \sim 0.8$

    "$m_u = 0$" $\alpha_8 \sim -0.9$

    (Gasser,Leutwyler,Bijnens,Ecker,...,1984-1992)

  studies in quenched QCD

  - Bardeen *et al.*, 2000
  - ALPHA, 2000

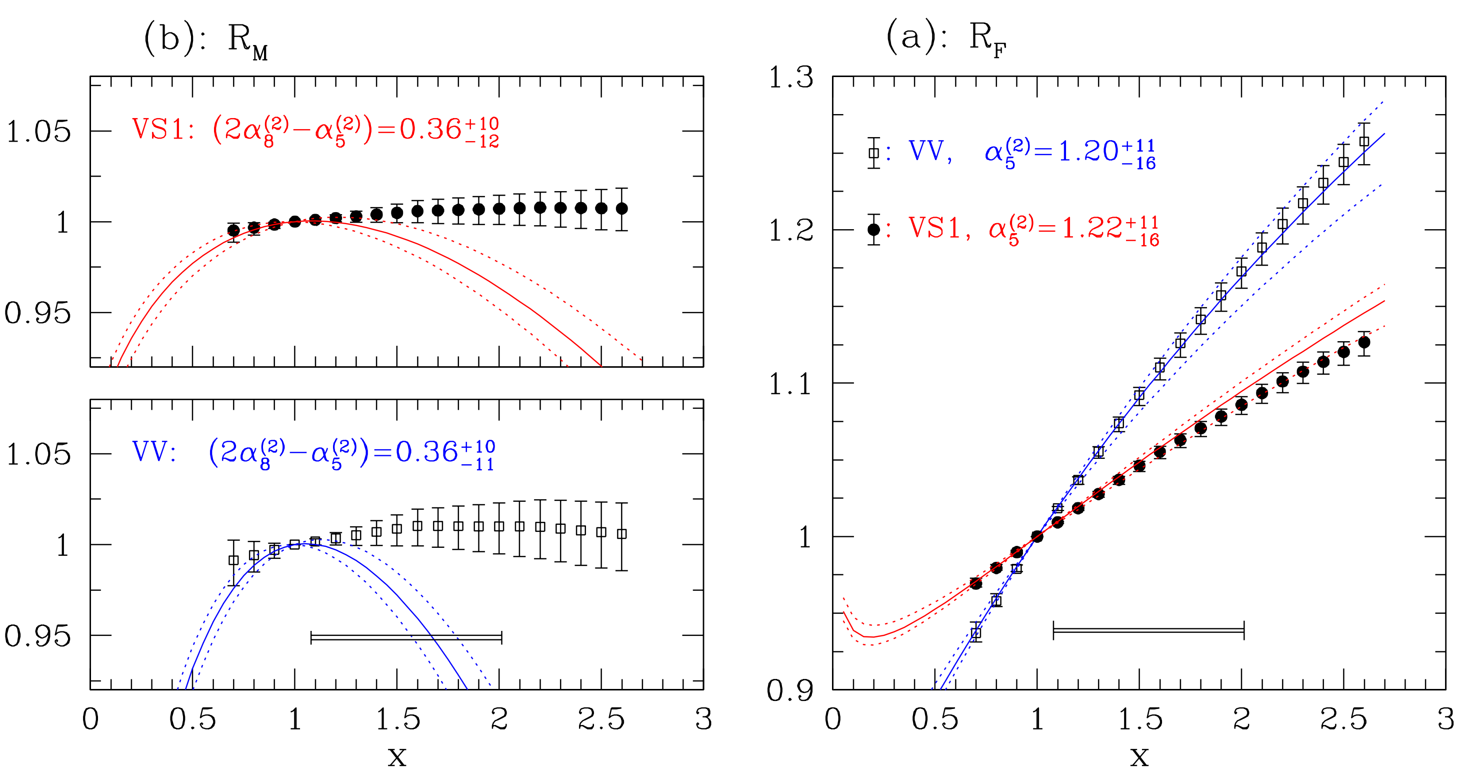
UKQCD : first estimate of α_8 in $N_f = 2$ full QCD

∘ "ratio" method of ALPHA, PQChPT formulae by Sharpe,

$$R_M^{VV} \equiv \frac{2y/m_{\rm PS}^2(y)}{2y_{\rm ref}/m_{\rm PS}^2(y_{\rm ref})} = (x-1)\,y_{\rm ref}\,(2\alpha_8 - \alpha_5) + \text{log terms}$$

$$R_F^{VV} \equiv \frac{f_{\rm PS}(y)}{f_{\rm PS}(y_{\rm ref})} = (x-1)\,y_{\rm ref}\,\alpha_5/2 + \text{log terms}$$

$$y \equiv B_0 m_q/(4\pi F)^2, \quad x = y/y_{\rm ref}$$



- $\alpha_5^{N_f=2} = 0.99(6)(20), \quad \alpha_8^{N_f=2} = 0.67(4)(20) \quad \Rightarrow \quad m_u \neq 0$

but...

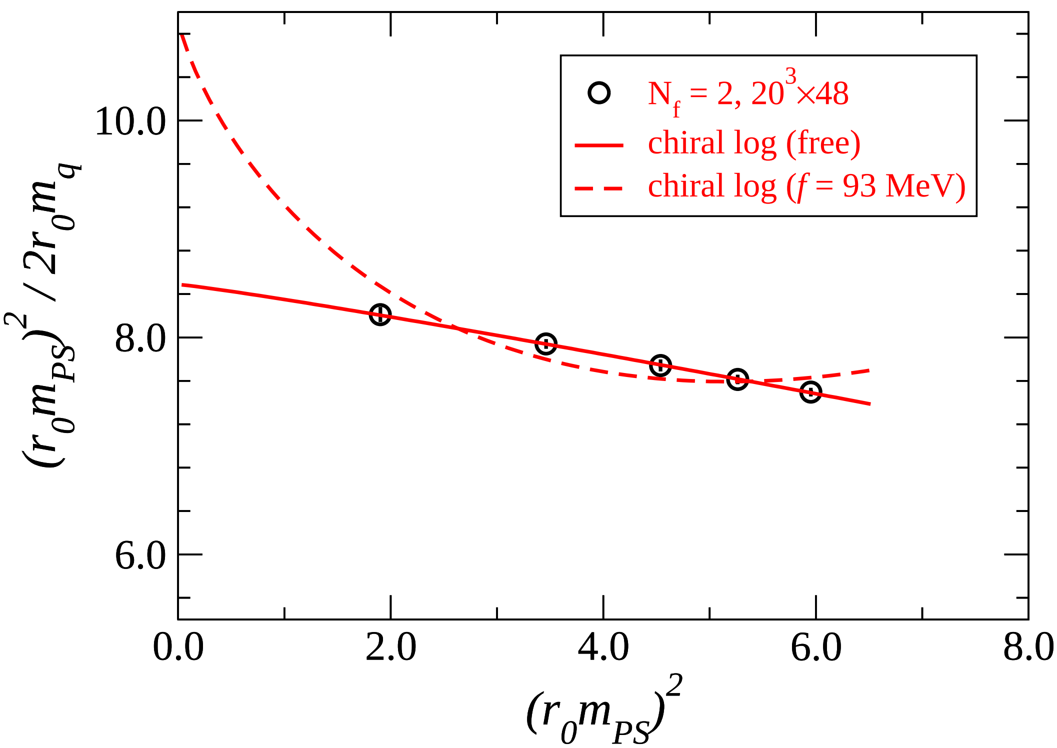
∘ fit for R_M does not seem good...

⇒ Are lattice data really consistent with PQChPT?

examination of ChPT log behavior in $N_f = 2$ QCD

$$m_q \equiv m_{q,\mathrm{val}} = m_{q,\mathrm{sea}}$$

$$\frac{M_{PS}^2}{2B_0 m_q} = 1 + \frac{y}{N_f}\ln[y] + y\left\{(\alpha_8 - \alpha_5) + N_f(\alpha_8 - \alpha_5)\right\}$$



- no clear evidence of chiral log
- no evidence also for "f_{PS} vs m_{PS}^2"

$\Rightarrow$ not consistent with ChPT ($m_{\mathrm{PS}}/m_{\mathrm{V}} \sim$ 0.6-0.8)

- finite size effects

- lattice artifacts

- higher order of ChPT

- sea quark mass ($m_{\rm PS}/m_{\rm V} \sim$ 0.6-0.8) isn't small enough

  D.Nelson *et al.*

  KS, $N_f = 3$, $m_q/m_s \geq 0.1$,

  R_M : better consistency with ChPT

<u>important works in future</u>

- explore (much) smaller sea quark masses also with Wilson type action.

  $\Rightarrow$ attempt by GRAL collaboration

- extend UKQCD's and JLQCD's attempts toward small sea quark masses.

3. determination of fundamental parameters of QCD; α_s and m_q

strong coupling

- famous calculation by NRQCD (Davies *et al.*, 1997)

$$\alpha_{\overline{\mathrm{MS}}}^{(N_f=5)}(M_Z) = 0.1174(24)$$

KS action for light quarks

$N_f = 0,\ 2$ (extrapolated to $N_f = 3$)

$\alpha_{\overline{\mathrm{MS}}}$ from α_P,   scale from Υ

---

important to confirm this results using Wilson-type action

- SESAM, 1999

similar calculation with Wilson action

$$\alpha_{\overline{\mathrm{MS}}}^{(5)}(M_Z) = 0.1118(17)$$

$\Rightarrow$ significantly smaller

scaling violation?

◦ Wilson action

Ph.Boucaud, *et al.* $N_f = 0,\ 2$

$\alpha_{\overline{\rm MS}}$ from three gluon vertex

scale from ρ

$\alpha^{(5)}_{\overline{\rm MS}}(M_Z) = 0.113(2)$

◦ $O(a)$ improved Wilson action

UKQCD at Lattice00 $N_f = 0,\ 2,\quad \alpha_{\overline{\rm MS}}$ from α_P,

scale from Υ

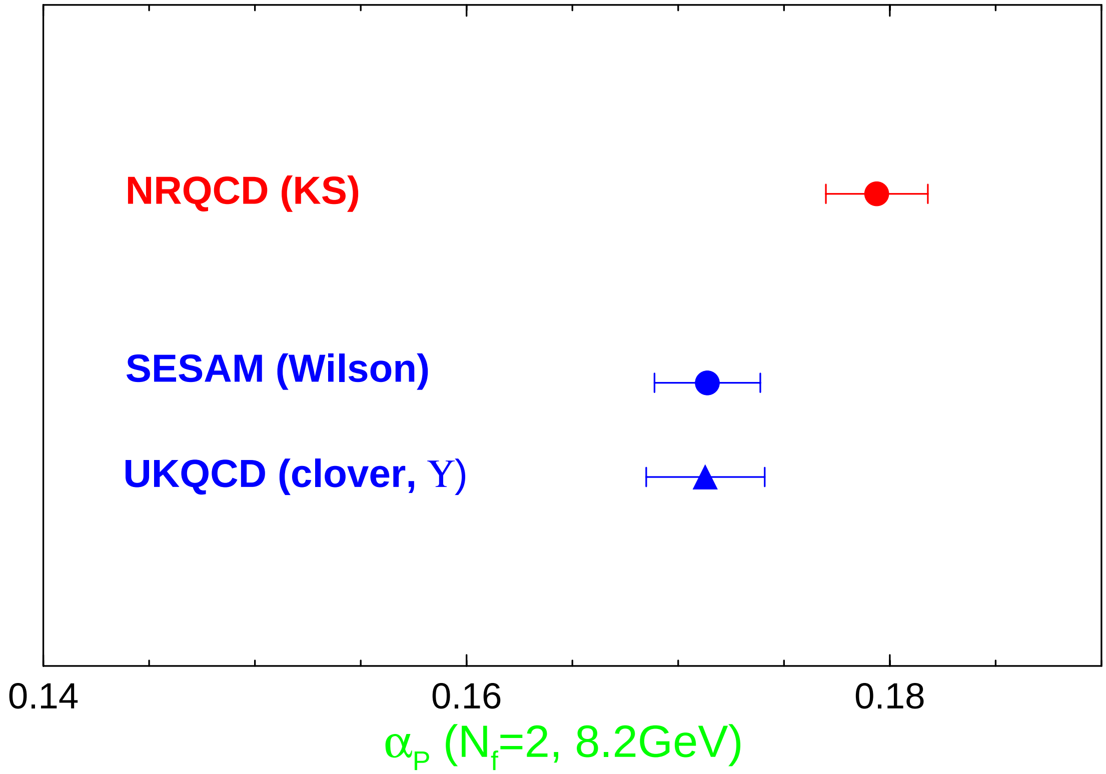
QCDSF+UKQCD $N_f = 0,\ 2,\quad \alpha_{\overline{\rm MS}}$ from α_P

scale from r_0

$\alpha^{(5)}_{\overline{\rm MS}}(M_Z) = 0.1076(20)(18)$

ALPHA

- ◦ non-perturbative evolution of $\alpha_{\rm SF}$ in $N_f = 2$
- ◦ determination of scale : in progress



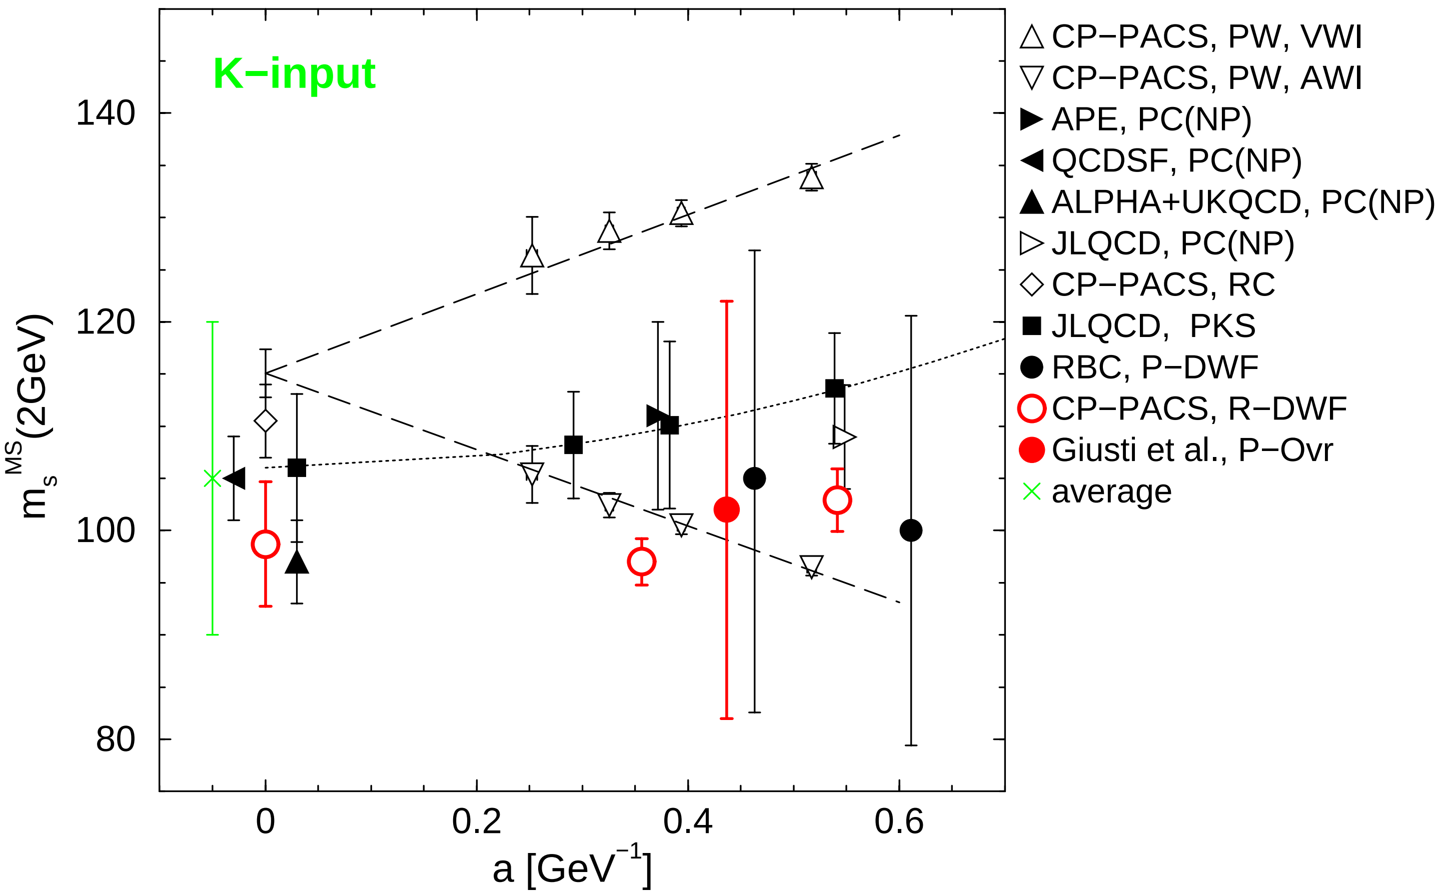
- all results using scale from Υ.
- smaller values for Wilson-type action.
- discrepancy is present before conversion to $\overline{\mathrm{MS}}$ scheme.
- reason is still unclear.
  - scaling violation?
  - higher order correction?

3.2.1 quenched QCD

strange quark mass

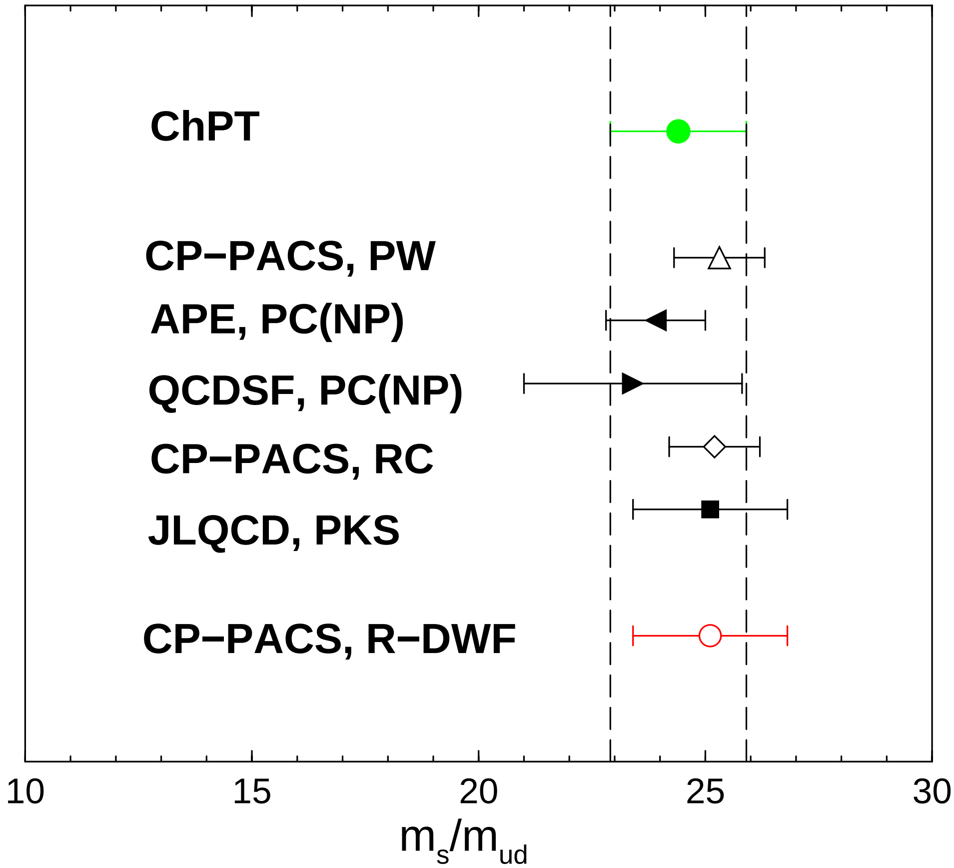
CP-PACS : domain-wall, $a_\rho^{-1} = 1.8,\ 2.8$ GeV, $La \sim 2.6,\ 2.3$ fm

Giusti *et al.* : overlap, $a_{f_K}^{-1} = 2.3$ GeV, $La \sim 1.4$ fm



$$m_s^{\overline{\rm MS}}(2\ \text{GeV}) = 105 \pm 15\ \text{MeV}$$

m_s/m_{ud}



- new result from CP-PACS :

  consistent with previous results and ChPT

- use ChPT ratio, average of m_s

  $\Rightarrow m_{ud}^{\overline{\rm MS}}(2\ \text{GeV}) = 4.5(7)$ MeV

- results with overlap fermion

  Giusti *et al.*, $m_{ud}^{\overline{\rm MS}}(2\ \text{GeV}) = 4.2(0.2)(0.7)$ MeV

  Dong *et al.*, $m_{ud}^{\overline{\rm MS}}(2\ \text{GeV}) = 4.6(1.2)(0.2)$ MeV

- this year

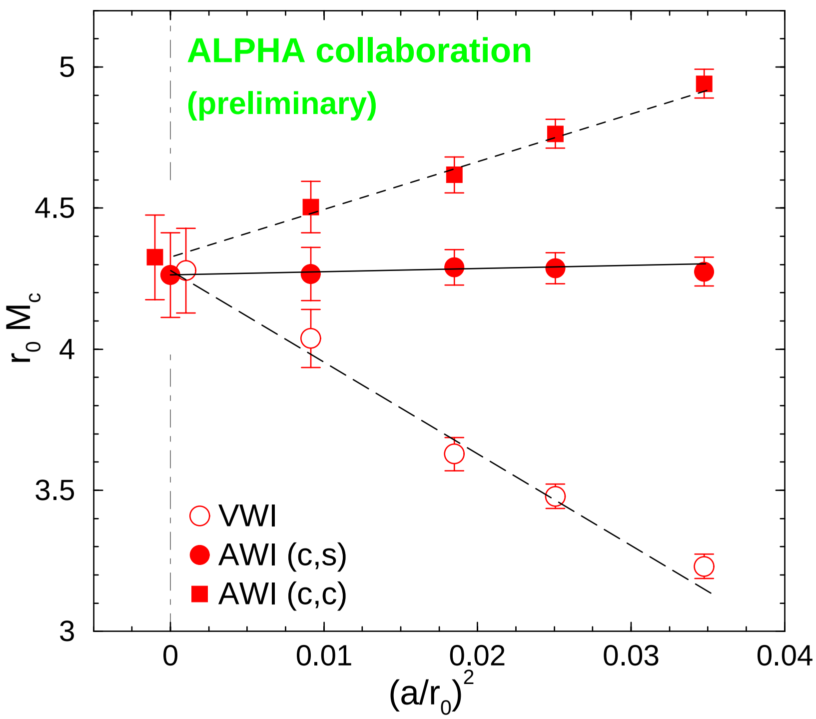
  Becirevic *et al.* : NP clover, NP Z, $a \sim 0.07$ fm

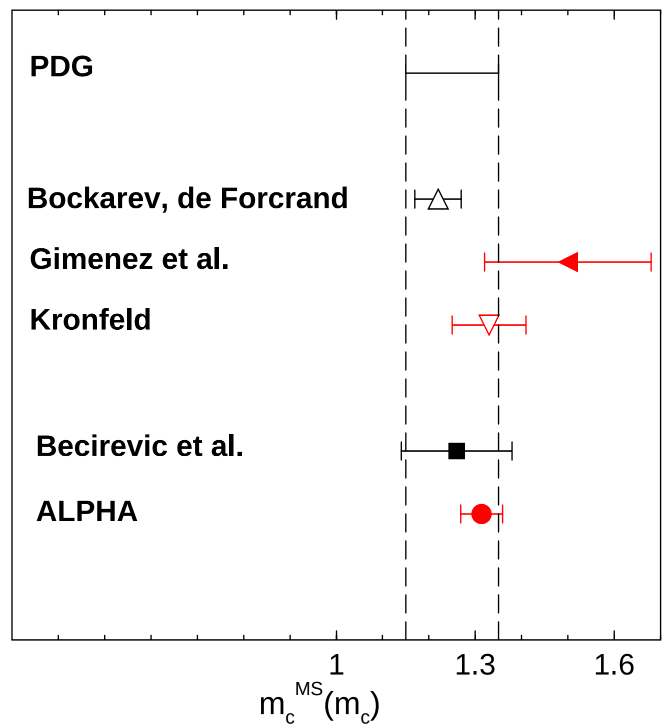
  ALPHA(Rolf) : NP clover, NP Z, $a \to 0$

  Juge *et al.* : clover, 2loop matching, $a \to 0$

- in relativistic lattice formulations

  $O((am_c)^n)$ error $\Rightarrow$ should take continuum limit





- Juge, *et al.* : very pleliminary, $m_c^{\overline{\rm MS}}(m_c) = 1.28(4)(??)$

- new results are $m_c^{\overline{\rm MS}}(m_c) \sim 1.3$ GeV

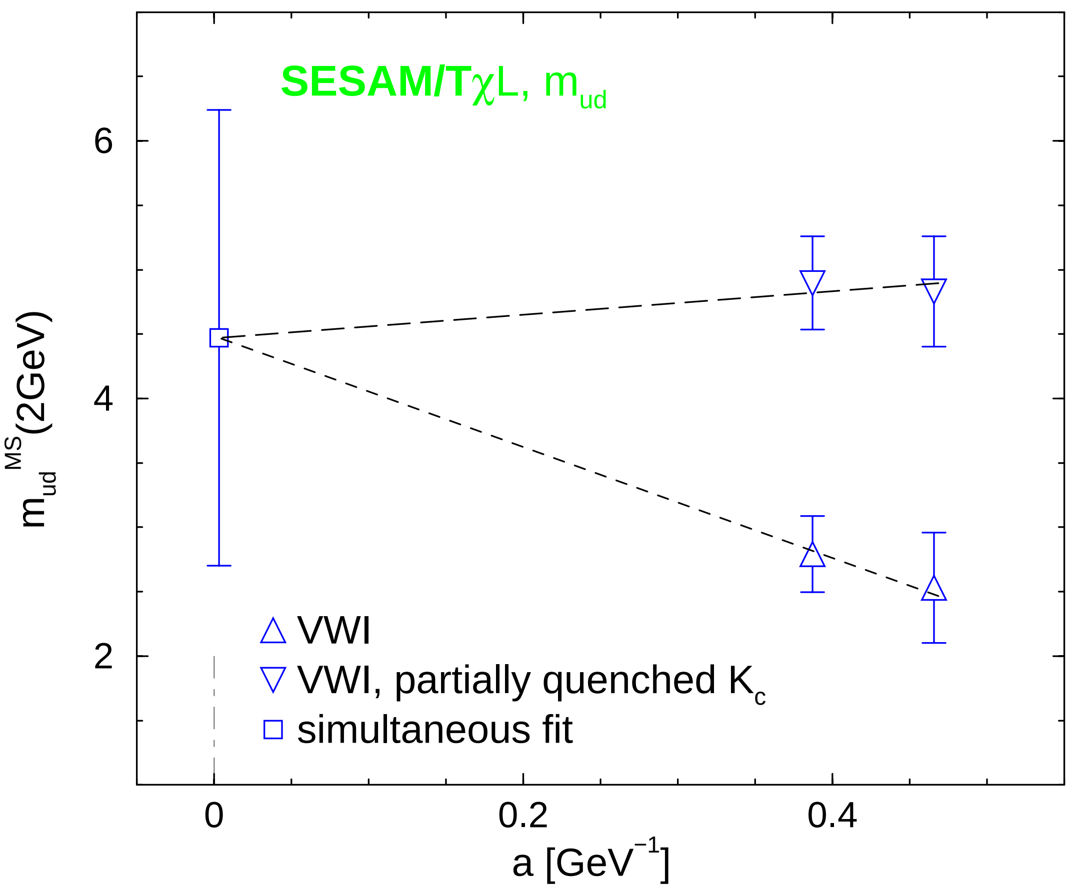
- largest error in ALPHA's result $\Leftarrow$ uncertainty in scale

  $\Rightarrow$ determination in full QCD

bottom quark mass $\Rightarrow$ review by Ryan

- this year

SESAM/TχL (Eicker) : 1 loop Z, $a^{-1} \sim$ 2.2, 2.6 GeV



- $m_{ud} =$ 4.5(1.7) MeV
- $m_s =$ 92(83) MeV
- $m_s/m_{ud} =$ 20(16) MeV
- large errors come from continuum extrpoaltion

  $\Rightarrow$ calculation at small lattice spacing is needed.

qunеched QCD : matured

- various methods have been tested and ready for applications.
  - non-perturbative improvement/renomalization
  - improved formulations

    (anisotropic lattices, domain-wall, overlap, twisted mass QCD)

  ⇒ implementation in full QCD.

N_f =2 full QCD : systematic invetigations by many groups

- sea quark effects in meson spectrum

  good! ... but, at finite lattice spacing (except CP-PACS)

- extensive simulations are still needed for

  scaling violation : fine lattices

  baryon : larger volumes

  test of ChPT : smaller sea quark masses

    high performance computer / "improved" formulations

- few progress for quark masses

  NP improvement/renormalization are required

N_f=3 full QCD : real world!

- ready for systematic studies.

  $\Leftarrow$ developement of algorithm/study of phase structure

- several groups started simulations with KS/Wilson action

$\Rightarrow$ We hope see interesting results at Lattice2002!!
