

# Status and Perspectives of Low Transverse Emittance Photo Cathode RF Guns

- experimental results from  
**ATF@BNL, SDL@BNL,  
GTF@SLAC, SHI+FESTA@Japan,  
A0@FNAL, ELBE@Rossendorf**
- experimental results from  
**PITZ@Zeuthen**
- How to reach the beam quality required  
for the XFEL ?

Frank Stephan (DESY Zeuthen),  
TESLA meeting, Zeuthen, January 2004

# Projected Emittance Measurements at ATF@BNL

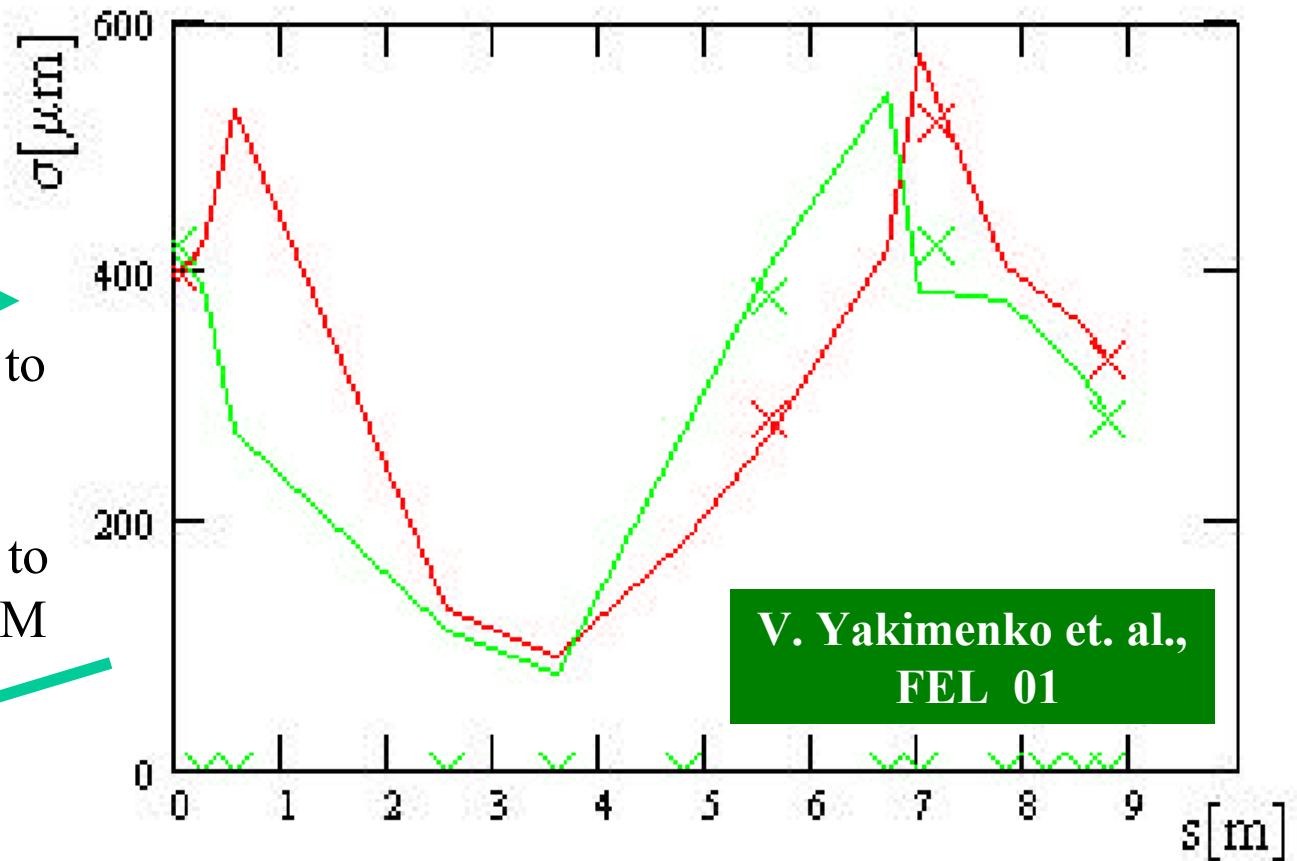

parameters:

- \* 0.5 nC
- \* 110 MV/m at gun
- \* beam energy: 60 MeV

method:

- \* fitting Twiss parameters to 4 subsequent beam size measurements
- \* transport optics adjusted to maximize beam size at BPM locations

fit result:

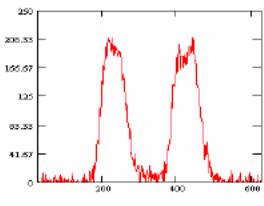

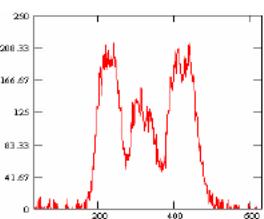

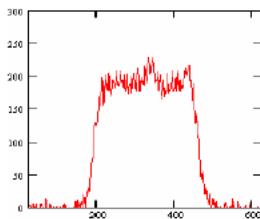

$\epsilon_n = 0.8 \mu\text{m}$  for 0.5 nC, accuracy: better than 15%

path to small emittance:

check resolution limit of BPM, stability of laser and RF, BBA of beam optical elements, improve gun gradient and QE, optimize transverse laser shape and emission phase, tune beam with SASE gain at VISA

# Transverse Laser Shape Studies from ATF@BNL

## cylindrical symmetric

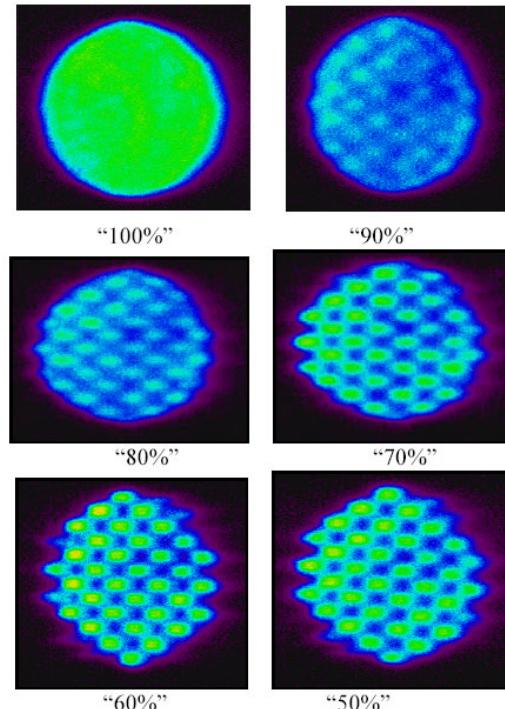

Upper left: type 1  
Upper right: type 2  
Middle left: type 3  
Middle right: type 4  
Lower left: type 5

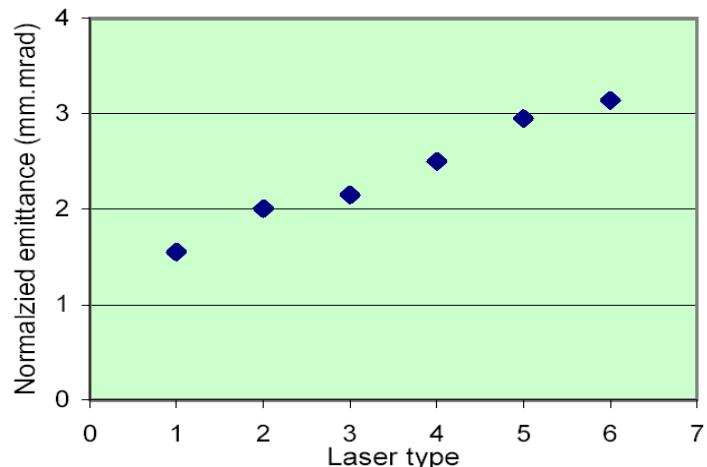

## parameters:

- **0.46 – 0.48 nC**
- **phase: 30° from zero crossing**
- **emittance measured at 40 MeV via quad scan**

## non-cylindrical symmetric

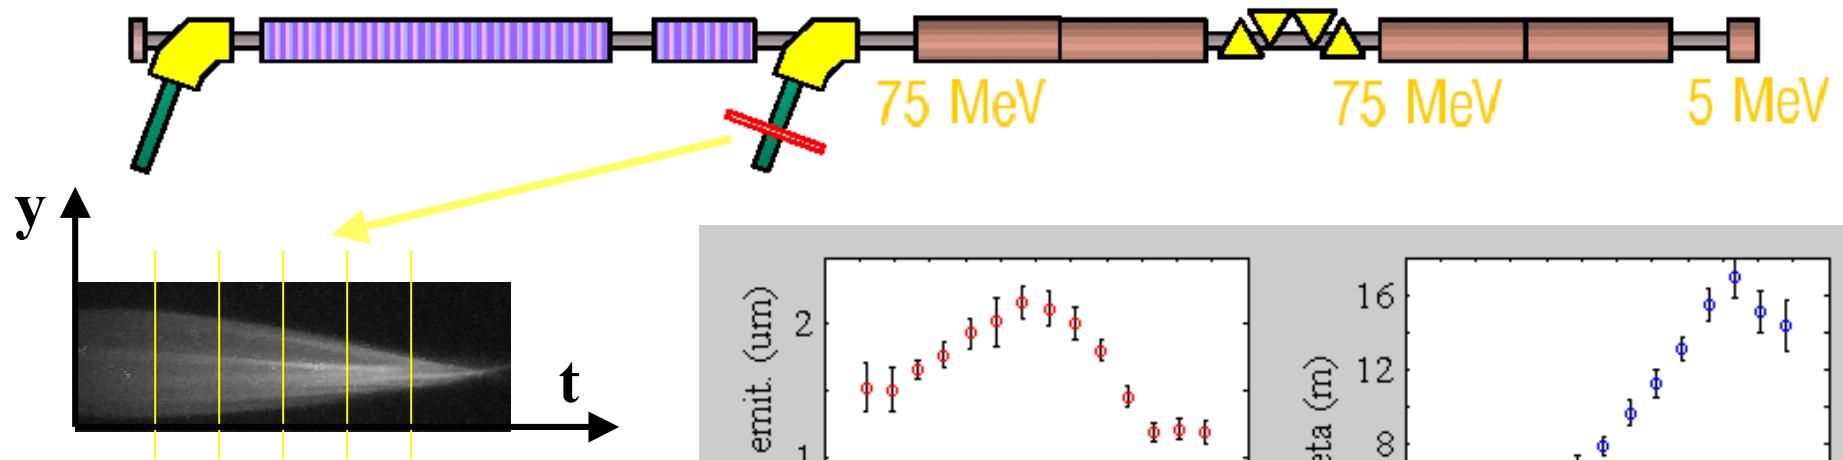

additional study:  
**emittance vs  
charge ~ linear**

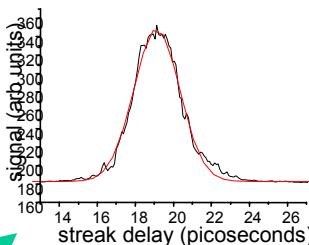

**F. Zhou et. al.,  
EPAC 02**

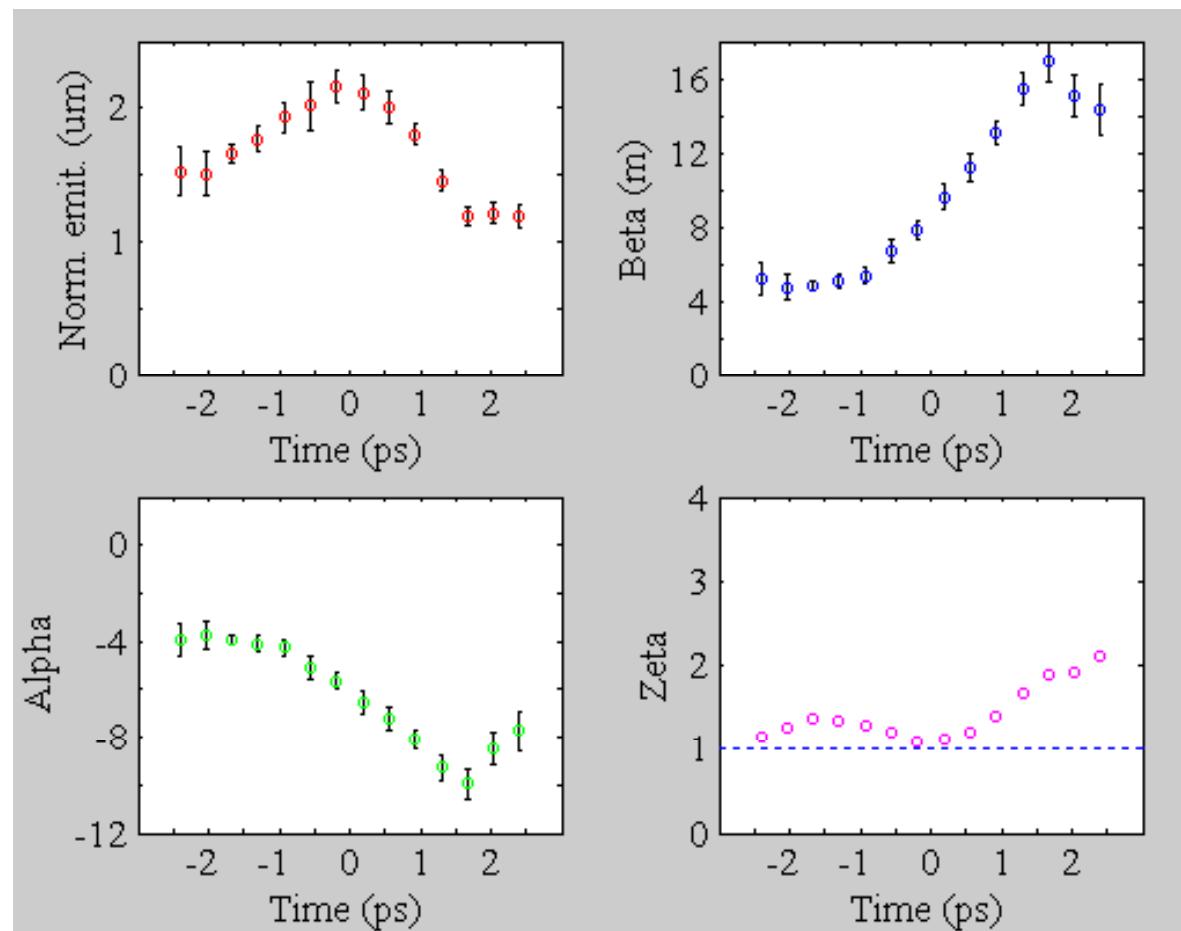

# Slice Emittance Measurements from SDL@BNL

## setup:

## parameters:

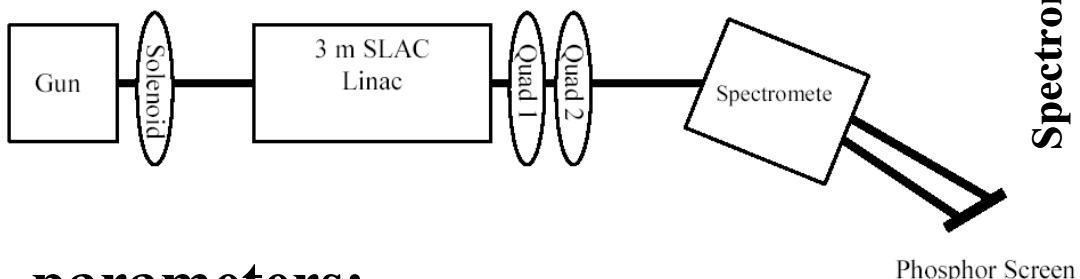

- **200 pC**
  - **75 MeV**
  - laser: **2.4 ps FWHM**
  - slice width **~400 fs**
- A plot showing the signal (in arbitrary units) versus streak delay (in picoseconds). The signal peaks at approximately 18 ps with a value of about 350. The x-axis ranges from 14 to 26 ps, and the y-axis ranges from 160 to 360.

Courtesy of W. Graves

# Slice Emittance Measurements from GTF@SLAC

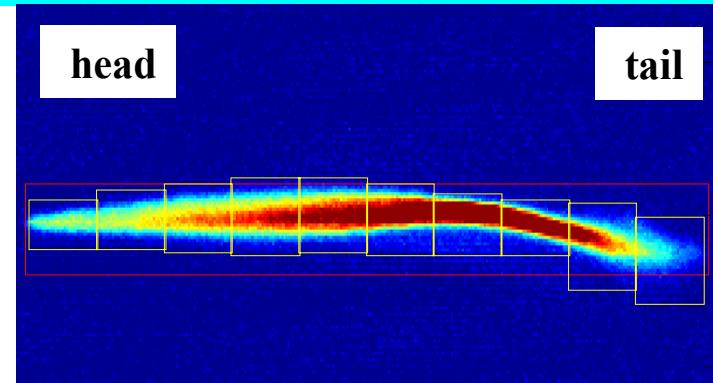

## setup:

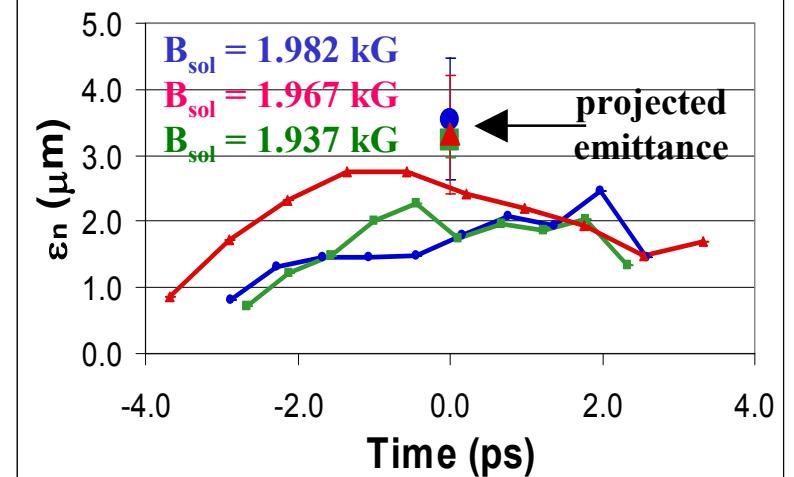

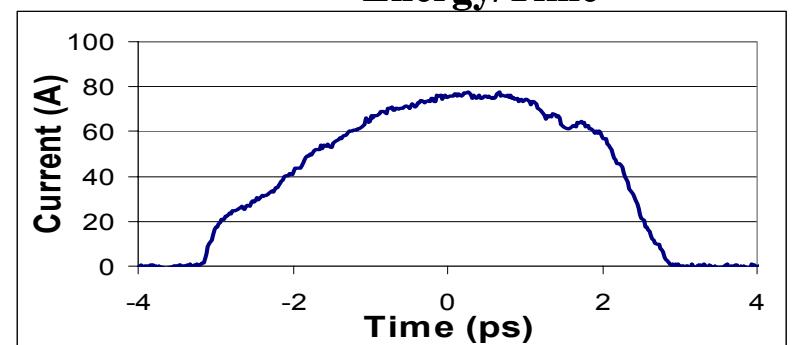

## parameters:

- **300 pC**
- **laser: 1.8 ps FWHM  
2 mm diameter on cathode**
- **phase: 30° from zero crossing**
- **slice width 550-750 fs**
- **beam size: signal cut at 5% of max.**

Energy/Time

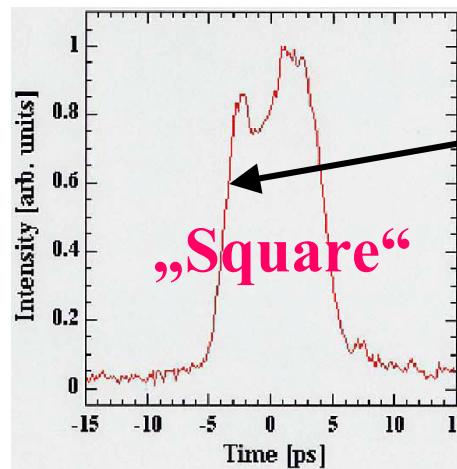

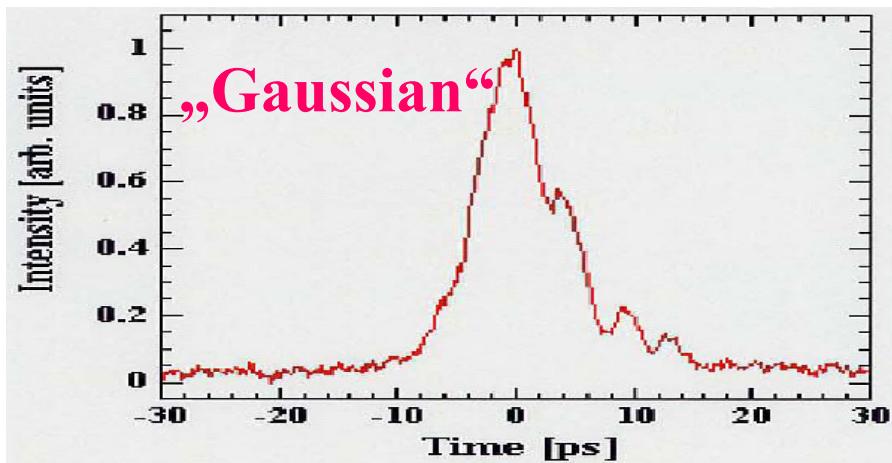

# Projected Emittance vs Charge from GTF@SLAC

Courtesy of  
J. Schmerge

# WR on Emittance from SHI+FESTA@Japan

- 1.6 cell S-band gun ( $\rightarrow 4$  MeV) + 70 cm SW linac ( $\rightarrow 14$  MeV)
- Ti:Saphire laser system ( $\rightarrow$  50 fs long pulses at 800 nm) + pulse shaping (e.g. gratings + liquid crystal spatial light modulator)
- temporal shape of laser pulses: (x-ray streak camera, resolution:  $\sim 2$  ps)

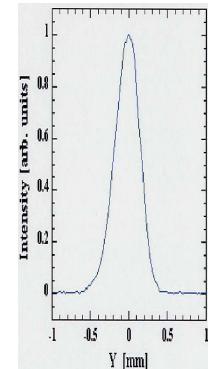

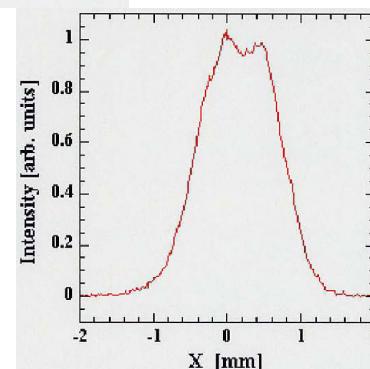

rise/decay time: 1.5 ps,  
limited by streak camera

- transverse laser distributions: (cathode)

# World Record on Emittance

## Emittance measurements for gaussian and square laser pulse shapes

Methode: quad scan @ 14 MeV, gaussian fit to background subtracted signal frames

$$\varepsilon_n = \sqrt{(a' Q)^2 + b'^2}$$

	$a'$	$b' = \sqrt{\varepsilon_{rf}^2 + \varepsilon_{th}^2}$
	$\pi\text{mm-mrad/nC}$	$\pi\text{mm-mrad}$
Gaussian(9ps)	$1.85 \pm 0.13$	$0.83 \pm 0.05$
Square (9ps)	$0.92 \pm 0.05$	$0.81 \pm 0.03$

For 1 nC:

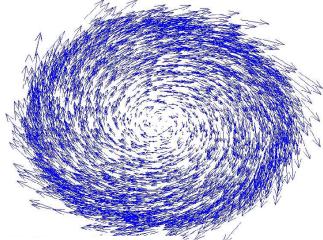

$\varepsilon_n \approx 1.2 \pi \text{ mm mrad}$

# Measurements at FNPL(A0)@FNAL

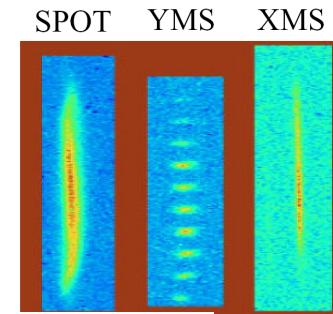

Courtesy of  
Ph. Piot  
et. al.

## flat beam production:

after solenoid field:

after skew quads:

proof-of-principle experiment done, measured:  $\frac{\varepsilon_y}{\varepsilon_x} = 45/0.9 \approx 50$   
→ now working for ratio > 100

towards polarized electrons: vacuum !! → cryogenic operated 1 ½ cell Cu gun

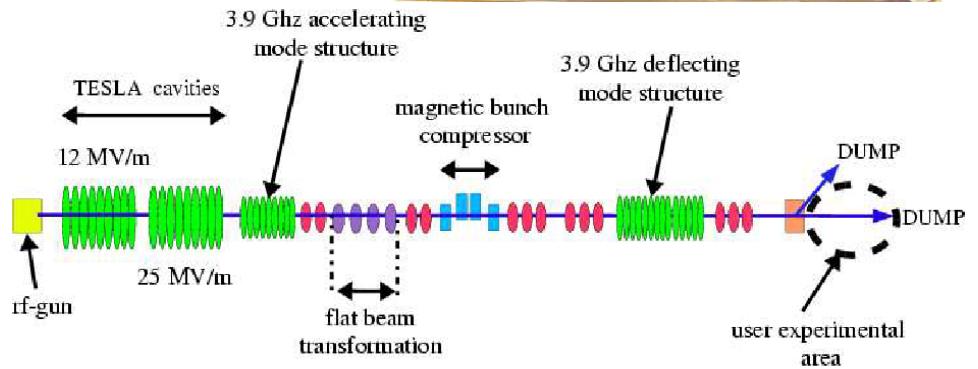

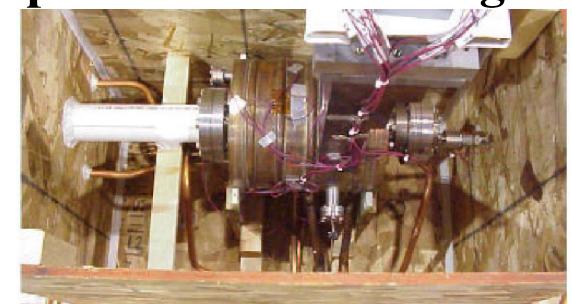

also working on e.g. plasma-wakefield acc.,  
laser-based acceleration (needs E upgrade)

NEXT:

energy upgrade

+ 3.9GHz accelerating structure

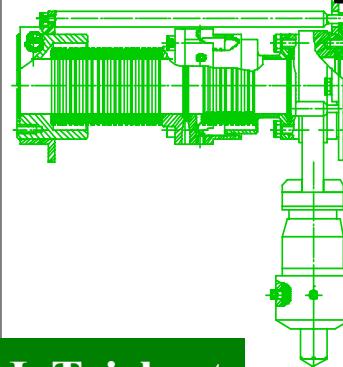

+ 3.9 GHz deflecting cavity

# SC RF Gun Development at ELBE@Rossendorf

1.3 GHz, 10 kW	
half cell & 3 TESLA cells	
$E_{z,\max} = 33 \text{ MV/m}$ (1/2 cell)	
= 50 MV/m (T cells)	
77 pC	1 nC
$I = 1 \text{ mA}$ CW	
$E = 9.5 \text{ MeV}$	
0.5 mm mrad	2.5 mm mrad

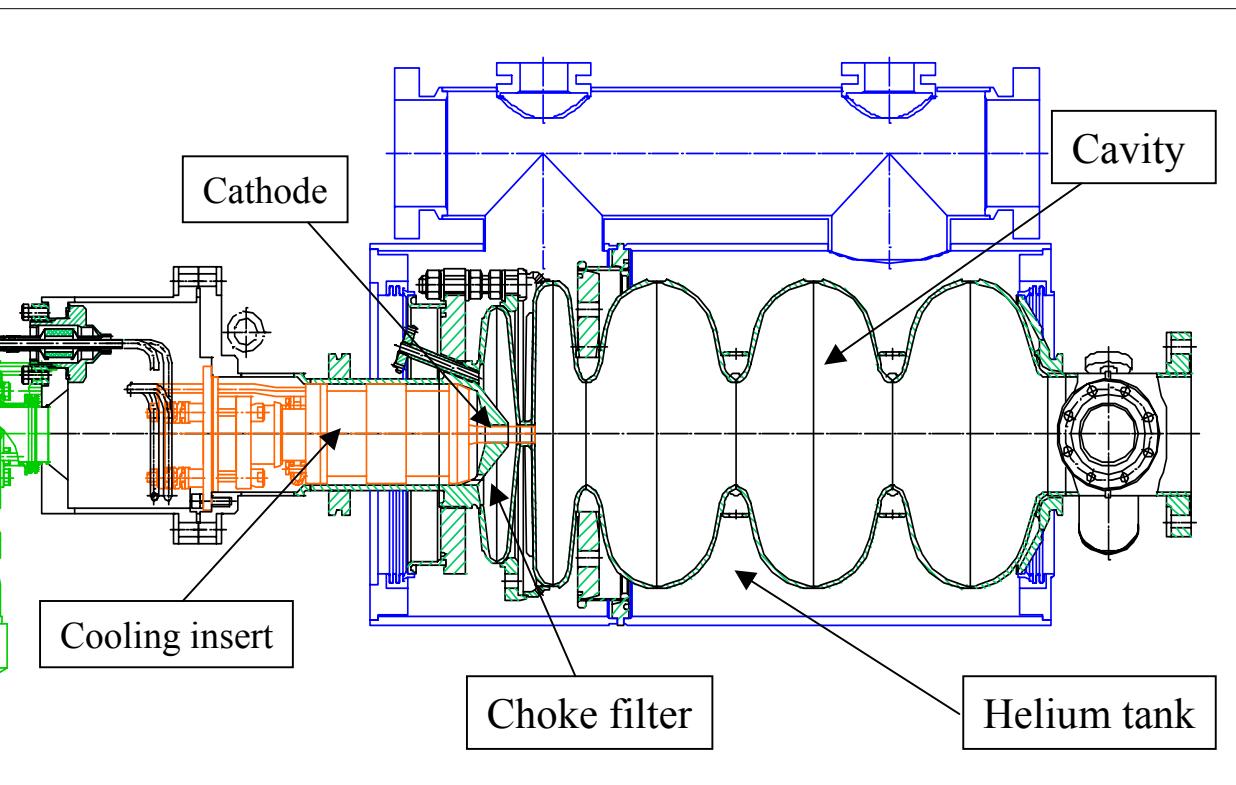

(without th. emit.)

# The Laser System at PITZ, ©MBI Berlin

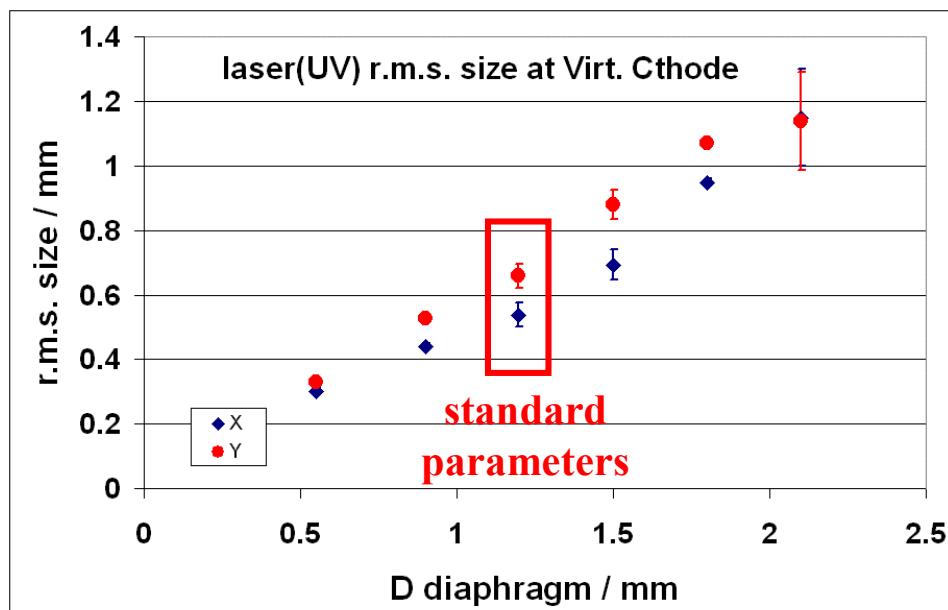

# Longitudinal and Transverse Laser Profiles

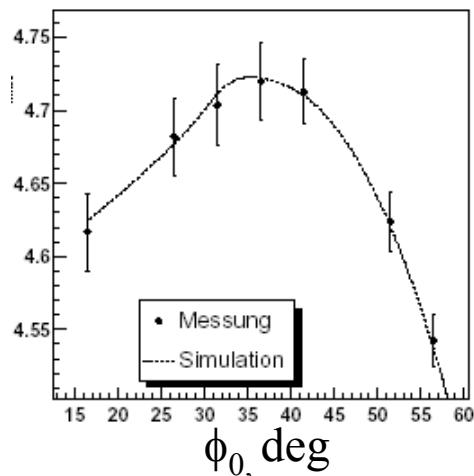

## variable transverse size:

round diaphragms in the laser room (~ 20 m from the cathode)  
are imaged on the cathode

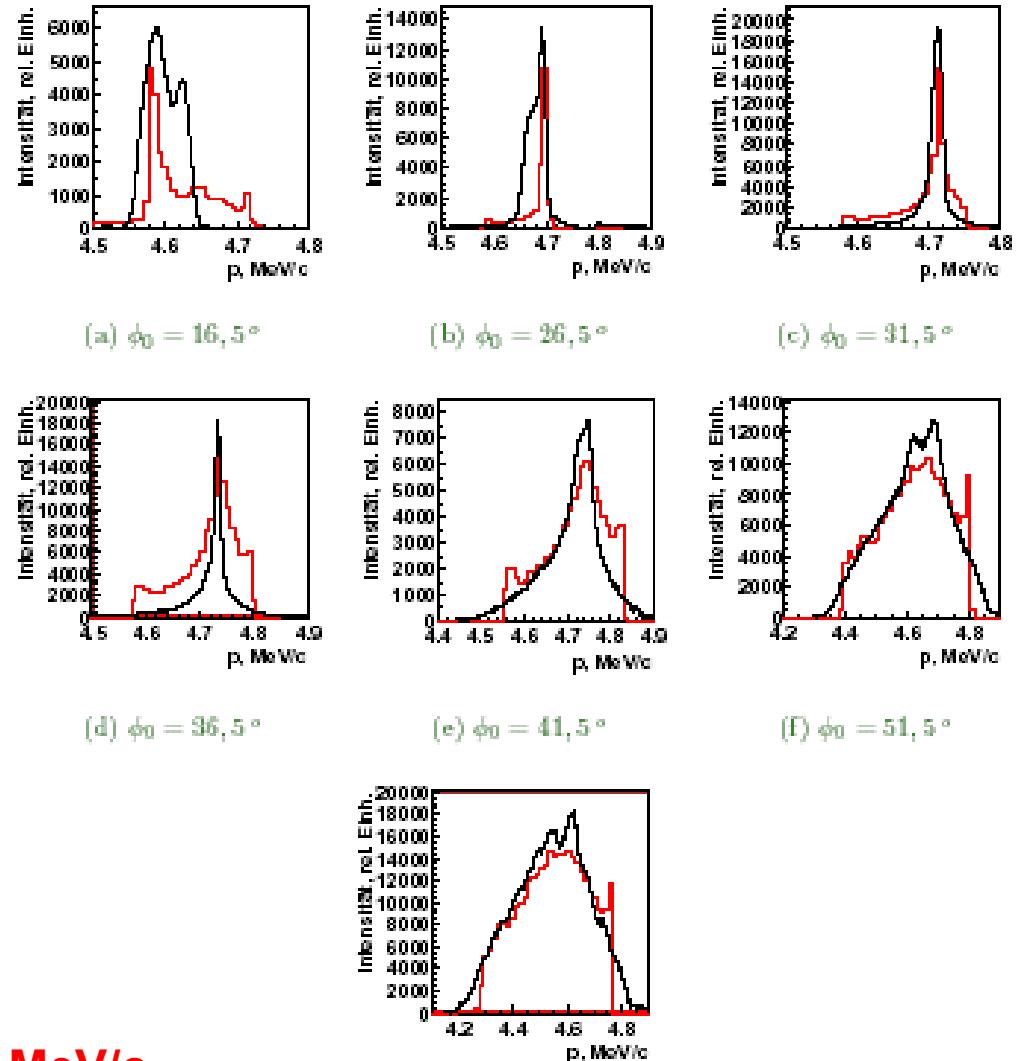

# Longitudinal Momentum of the Electron Beam

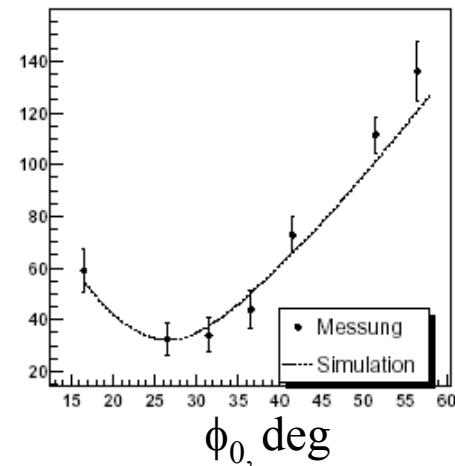

Mean momentum vs RF phase

Measurement compared to simulation for different  $\phi_0$

RMS momentum spread vs RF phase

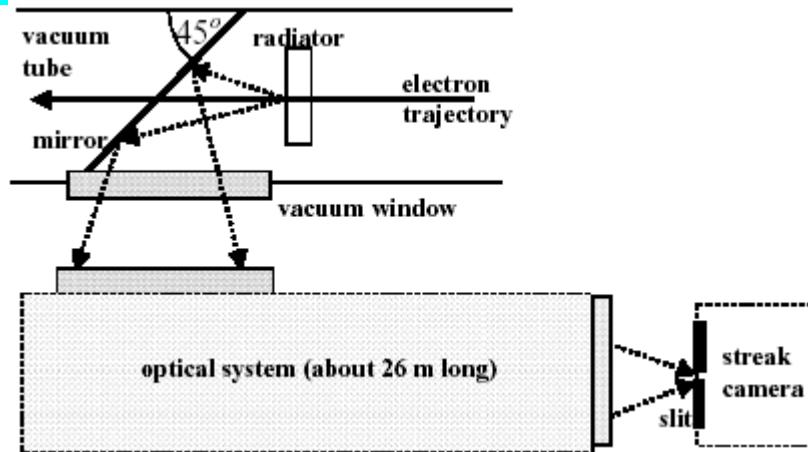

Maximum mean momentum **4.72 MeV/c**

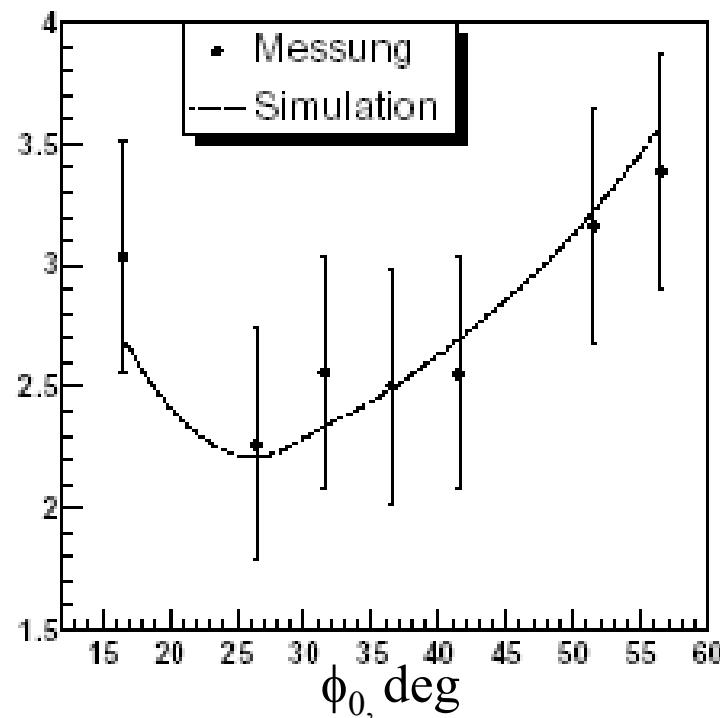

Minimum rms momentum spread **33 keV/c**

(g)  $\phi_0 = 56,5^\circ$

# Electron Beam Longitudinal Profile

Bunch length (mm) in RMS 90 %:

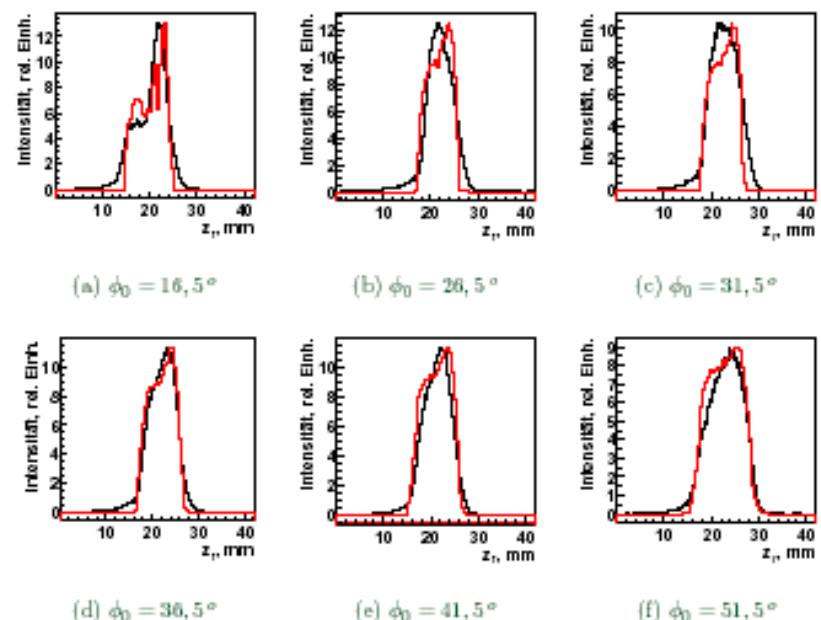

Cherenkov radiation

use of **aerogel**:  $\text{SiO}_2$ ,

refractive index  $\approx 1.03$

Measurement compared to simulation for different  $\phi_0$

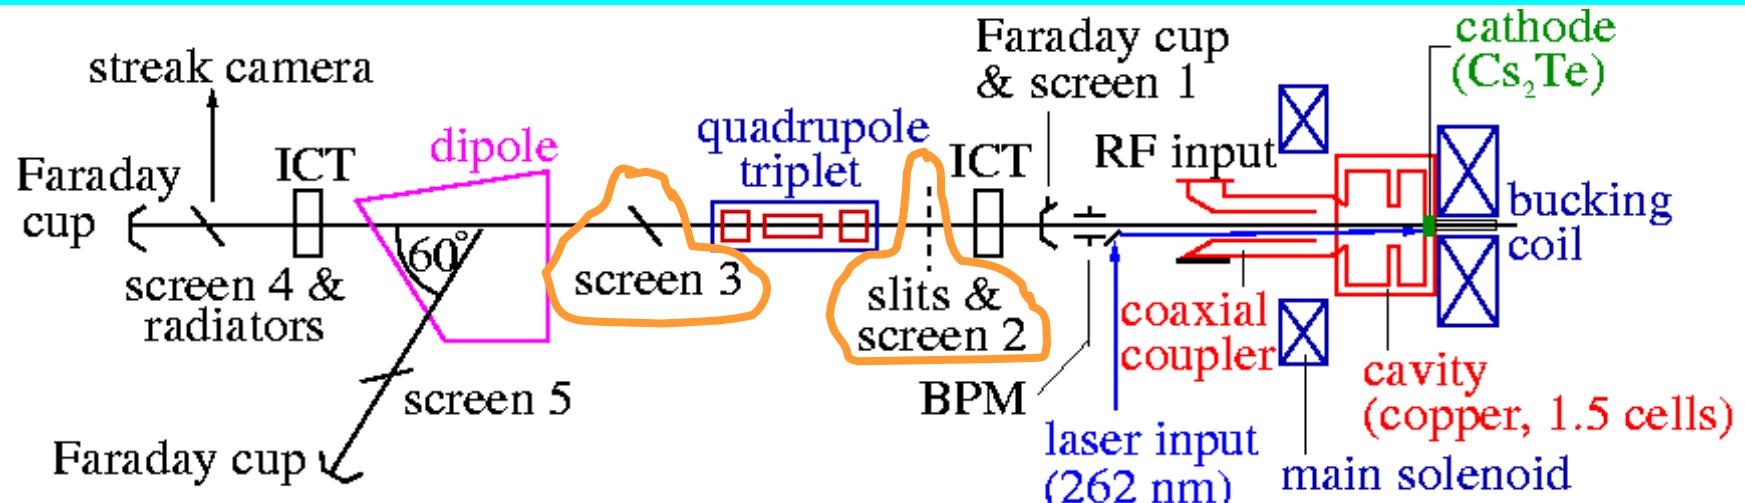

Minimum bunch length:

$$\text{FWHM} = (21.04 \pm 0.45\text{stat} \pm 4.14\text{syst}) \text{ ps}$$

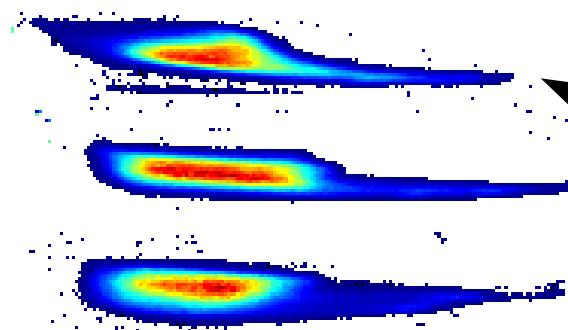

$$= (6.31 \pm 0.14\text{stat} \pm 1.24\text{syst}) \text{ mm}$$

# Transverse Beam Emittance Measurement

## Single Slit Scan Technique

Beamlets at screen 3

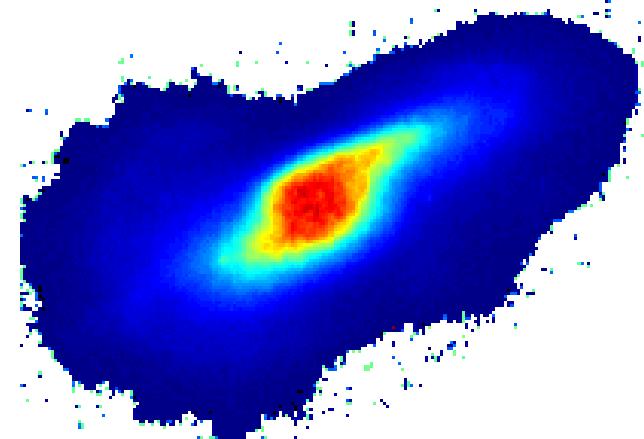

single slit position

size of the beamlet is measured for three slit positions:

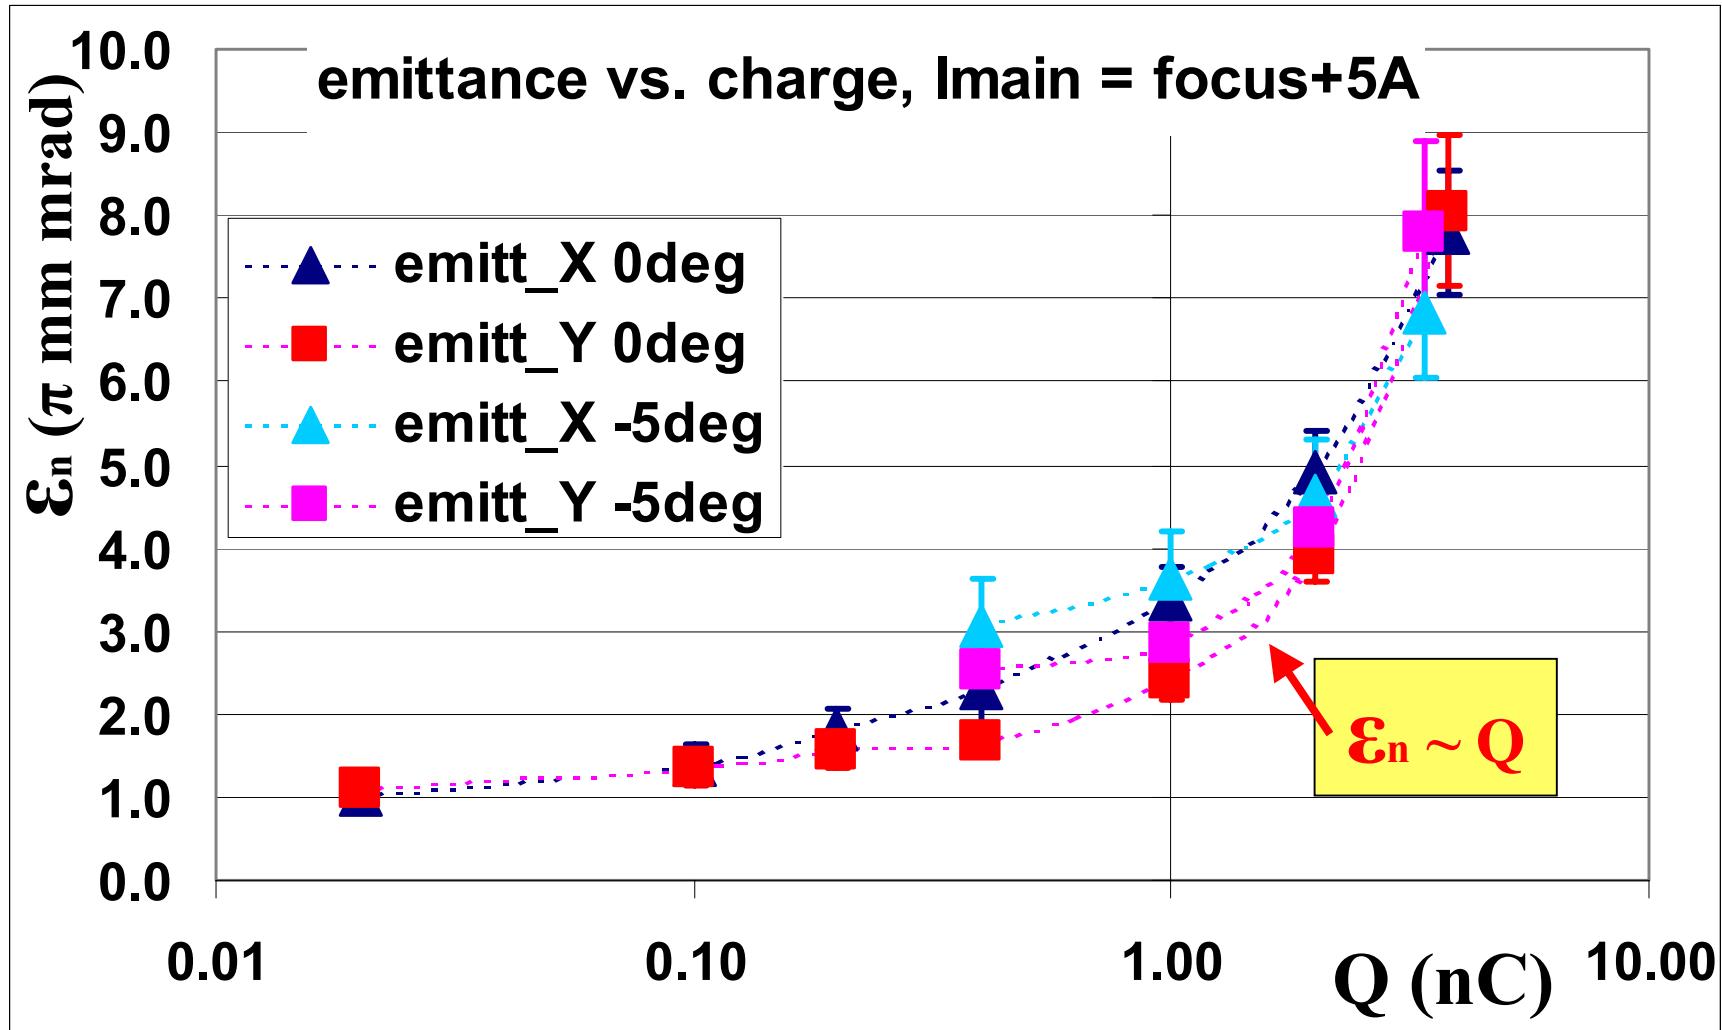

$$y_n = \langle Y \rangle^{\text{screen 2}} + n \cdot 0.7 \sigma_y^{\text{screen 2}}$$
$$n \in \{-1, 0, 1\}$$

Beam spot at screen 2

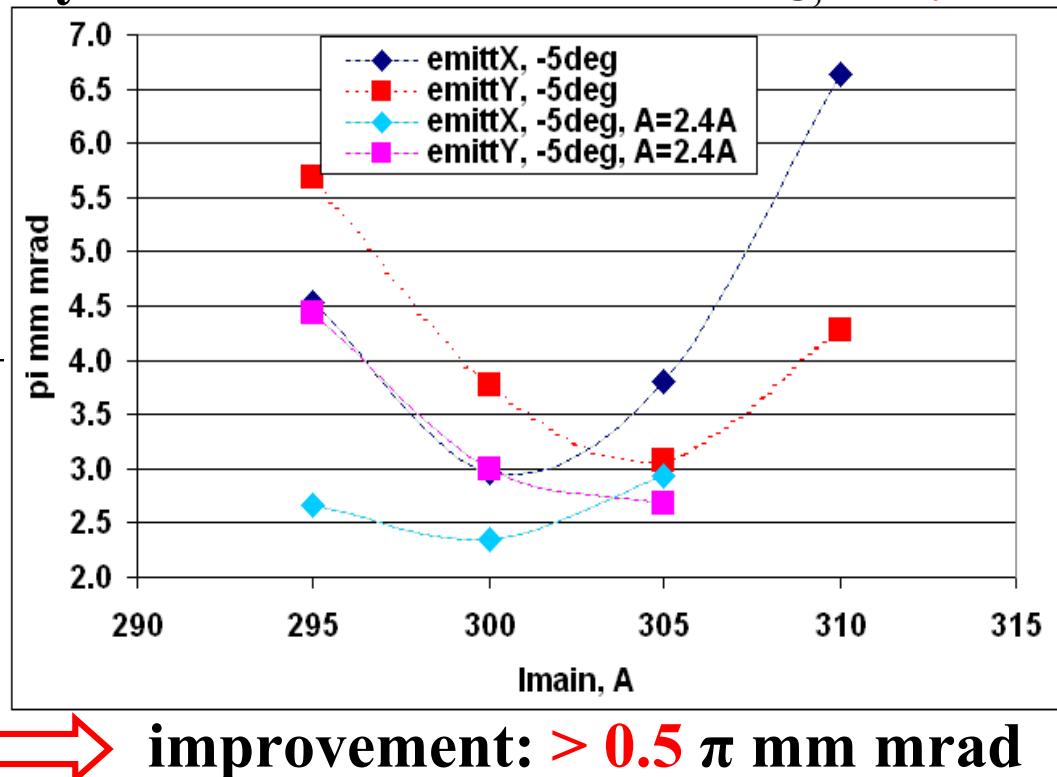

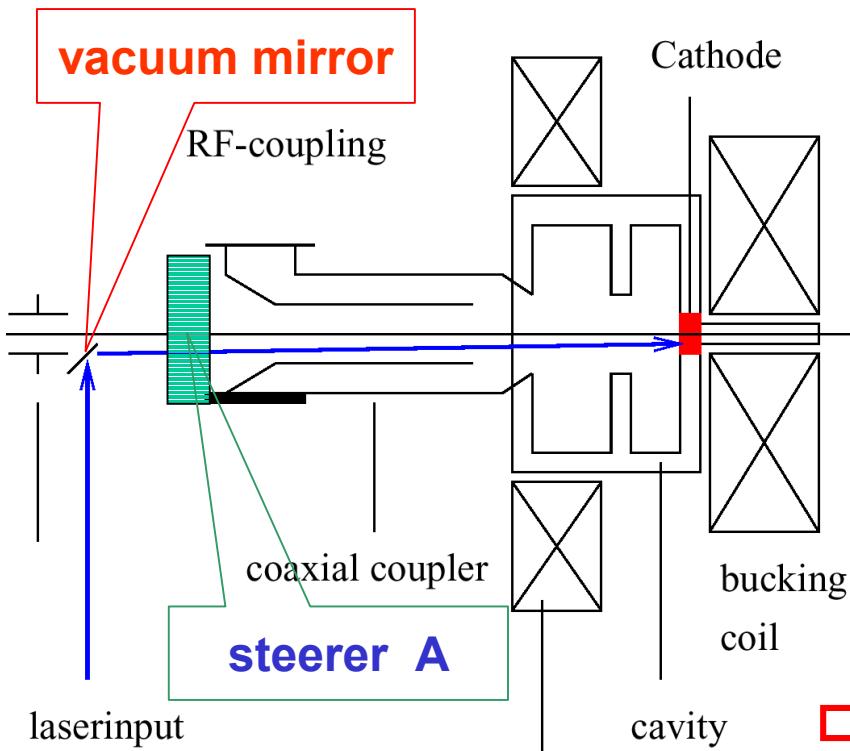

# Transverse Emittance vs Bunch Charge

laser diaphragm diameter  $D = 1.0 \text{ mm}$  (not final optimum)

# Steps to improve Beam Emittance

- status in Sept. 2003: min. emittance  $\approx 3 \pi \text{ mm mrad}$
- improvement: steer beam away from vacuum mirror 1 nC, D = 1.2 mm

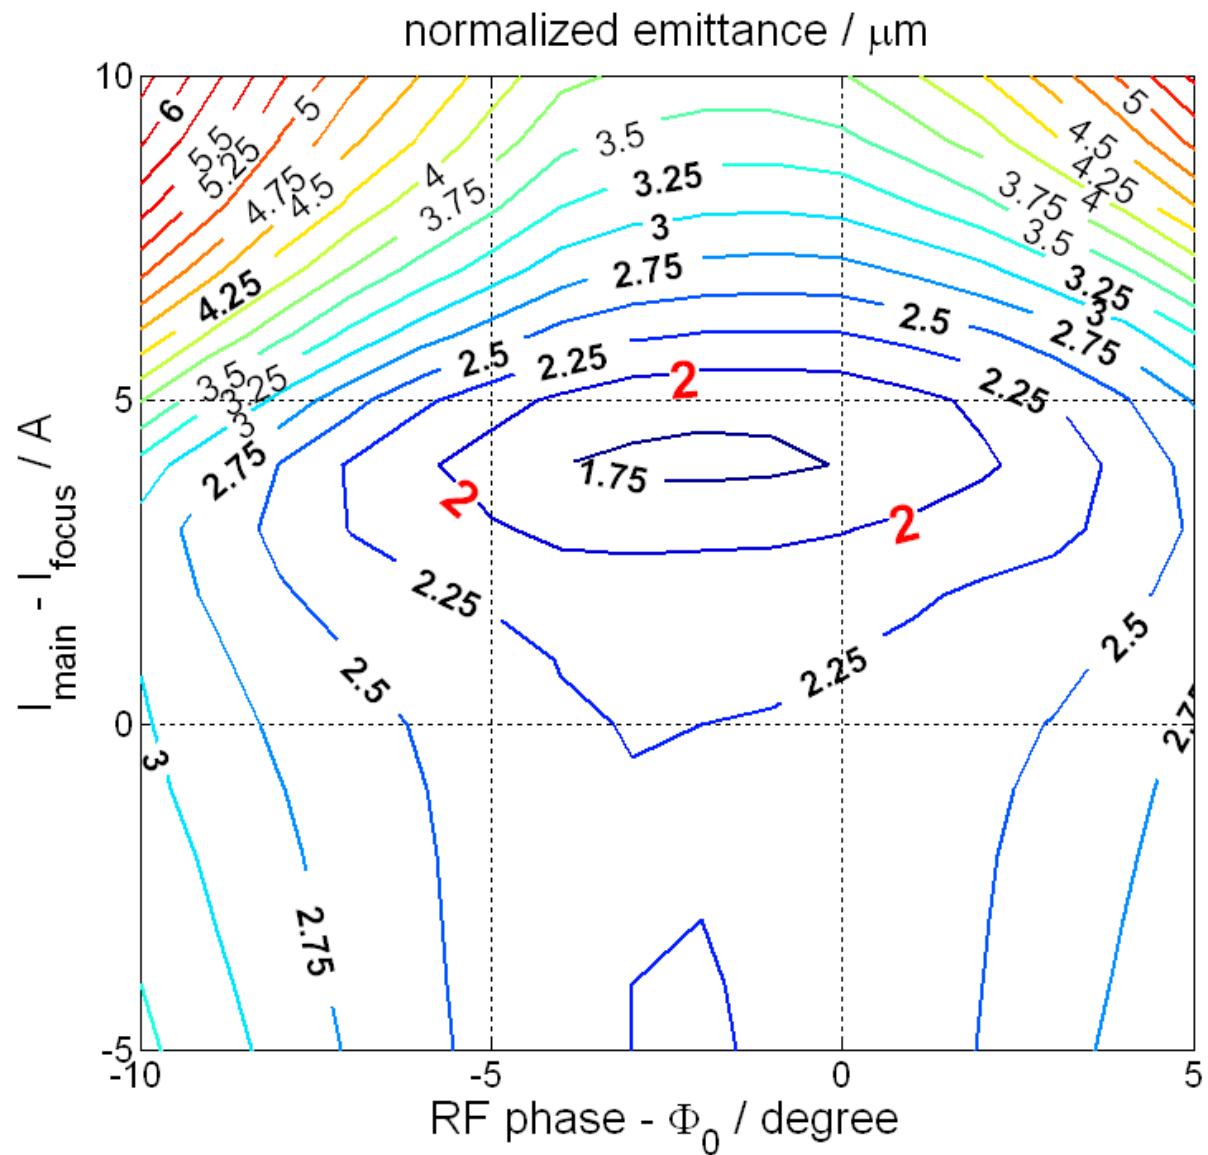

- systematic experimental optimization: long. laser profile, trans. laser profile, 2D scan  $I_{\text{main}}$  and RF phase,  $I_{\text{buck}}$  for fine tuning

# ASTRA Simulation of Transverse Emittance

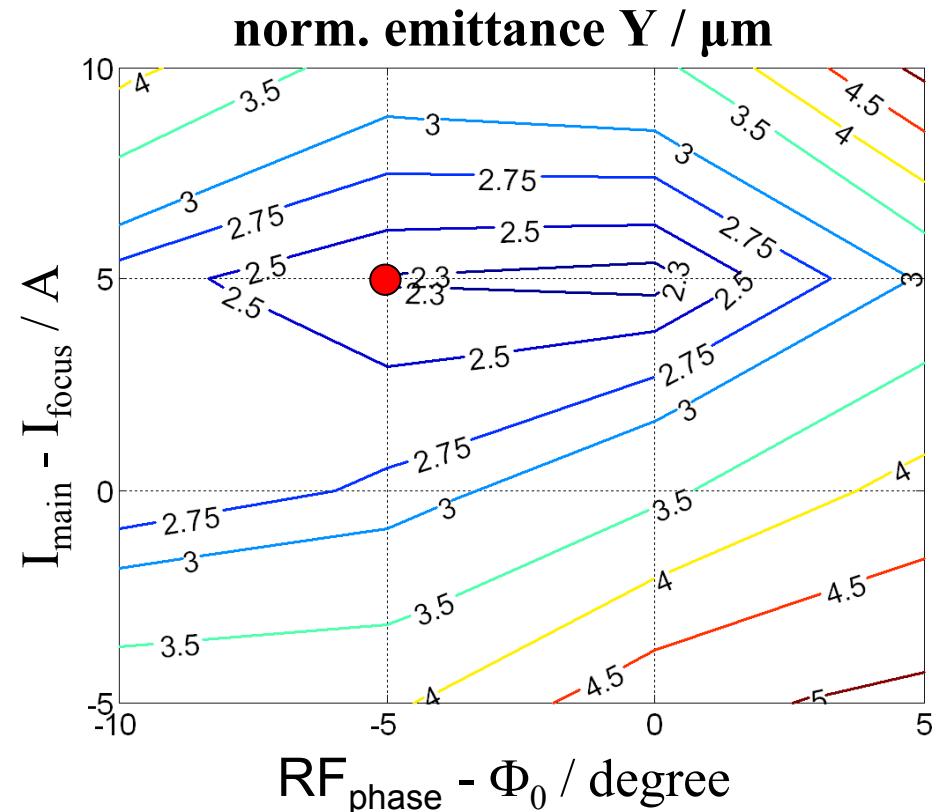

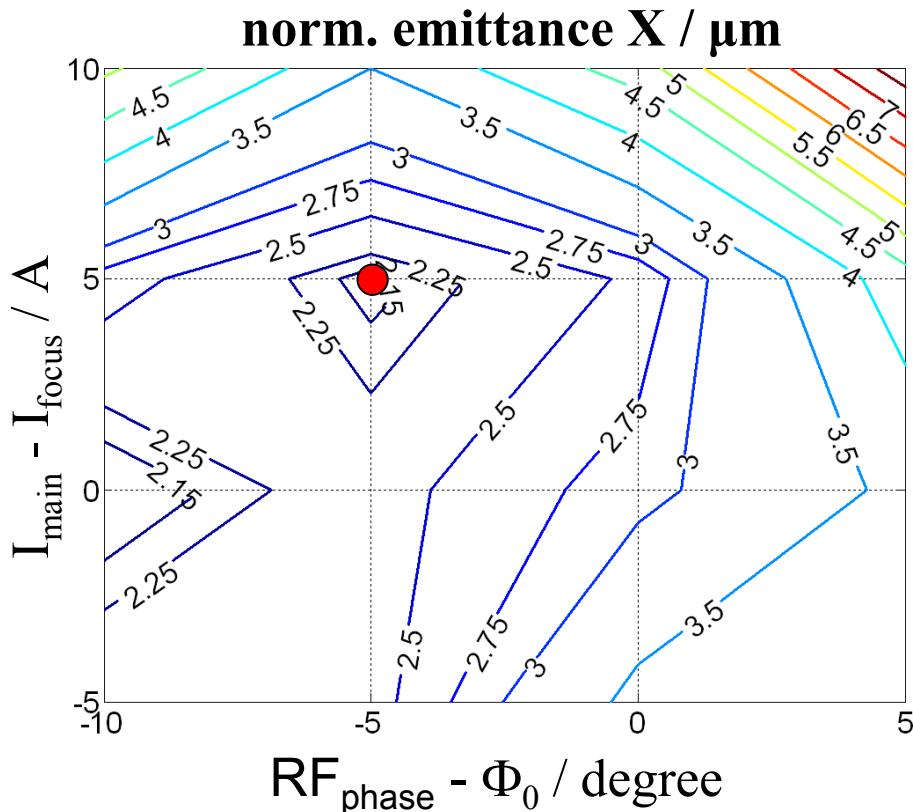

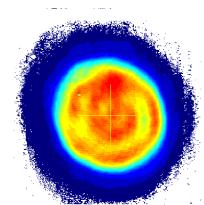

Parameters used for the simulation:

- charge = 1 nC
- longitudinal laser profile:
  - flat top
  - 20 ps FWHM
  - 5 ps rise/fall time
- transverse laser profile
  - homogeneous
  - $\sigma_{x,y} = 0.6 \text{ mm}$
- max. gradient at the cathode: 42 MV/m

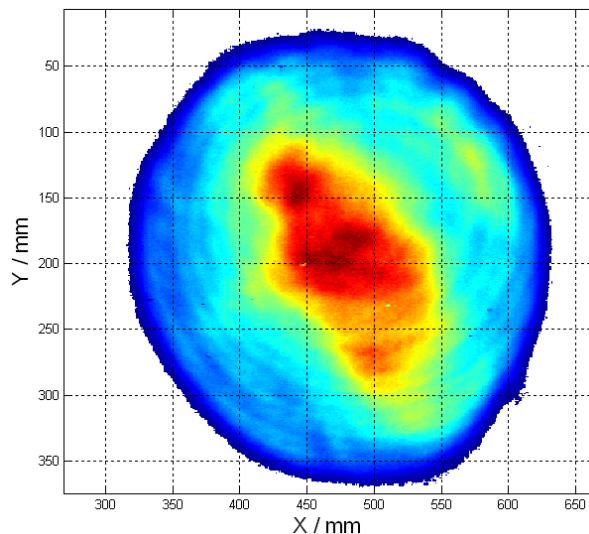

# Transverse Emittance Measurements

Parameters: 1 nC, ~20 ps FWHM, ~7ps rise/fall time,  
diaphragm = 1.2 mm

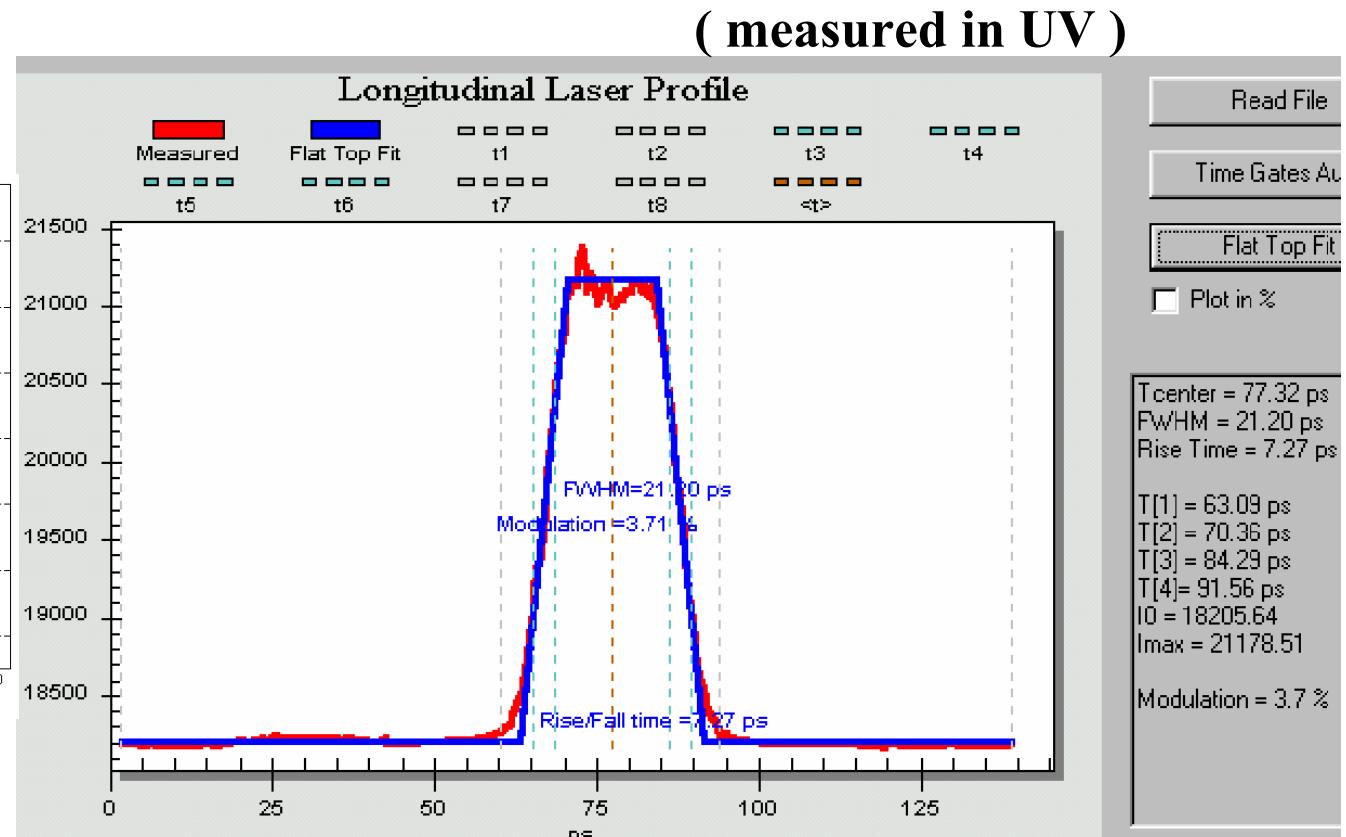

# Fine Tuning of Laser Parameters

transverse profile  
( D=1.2 mm )

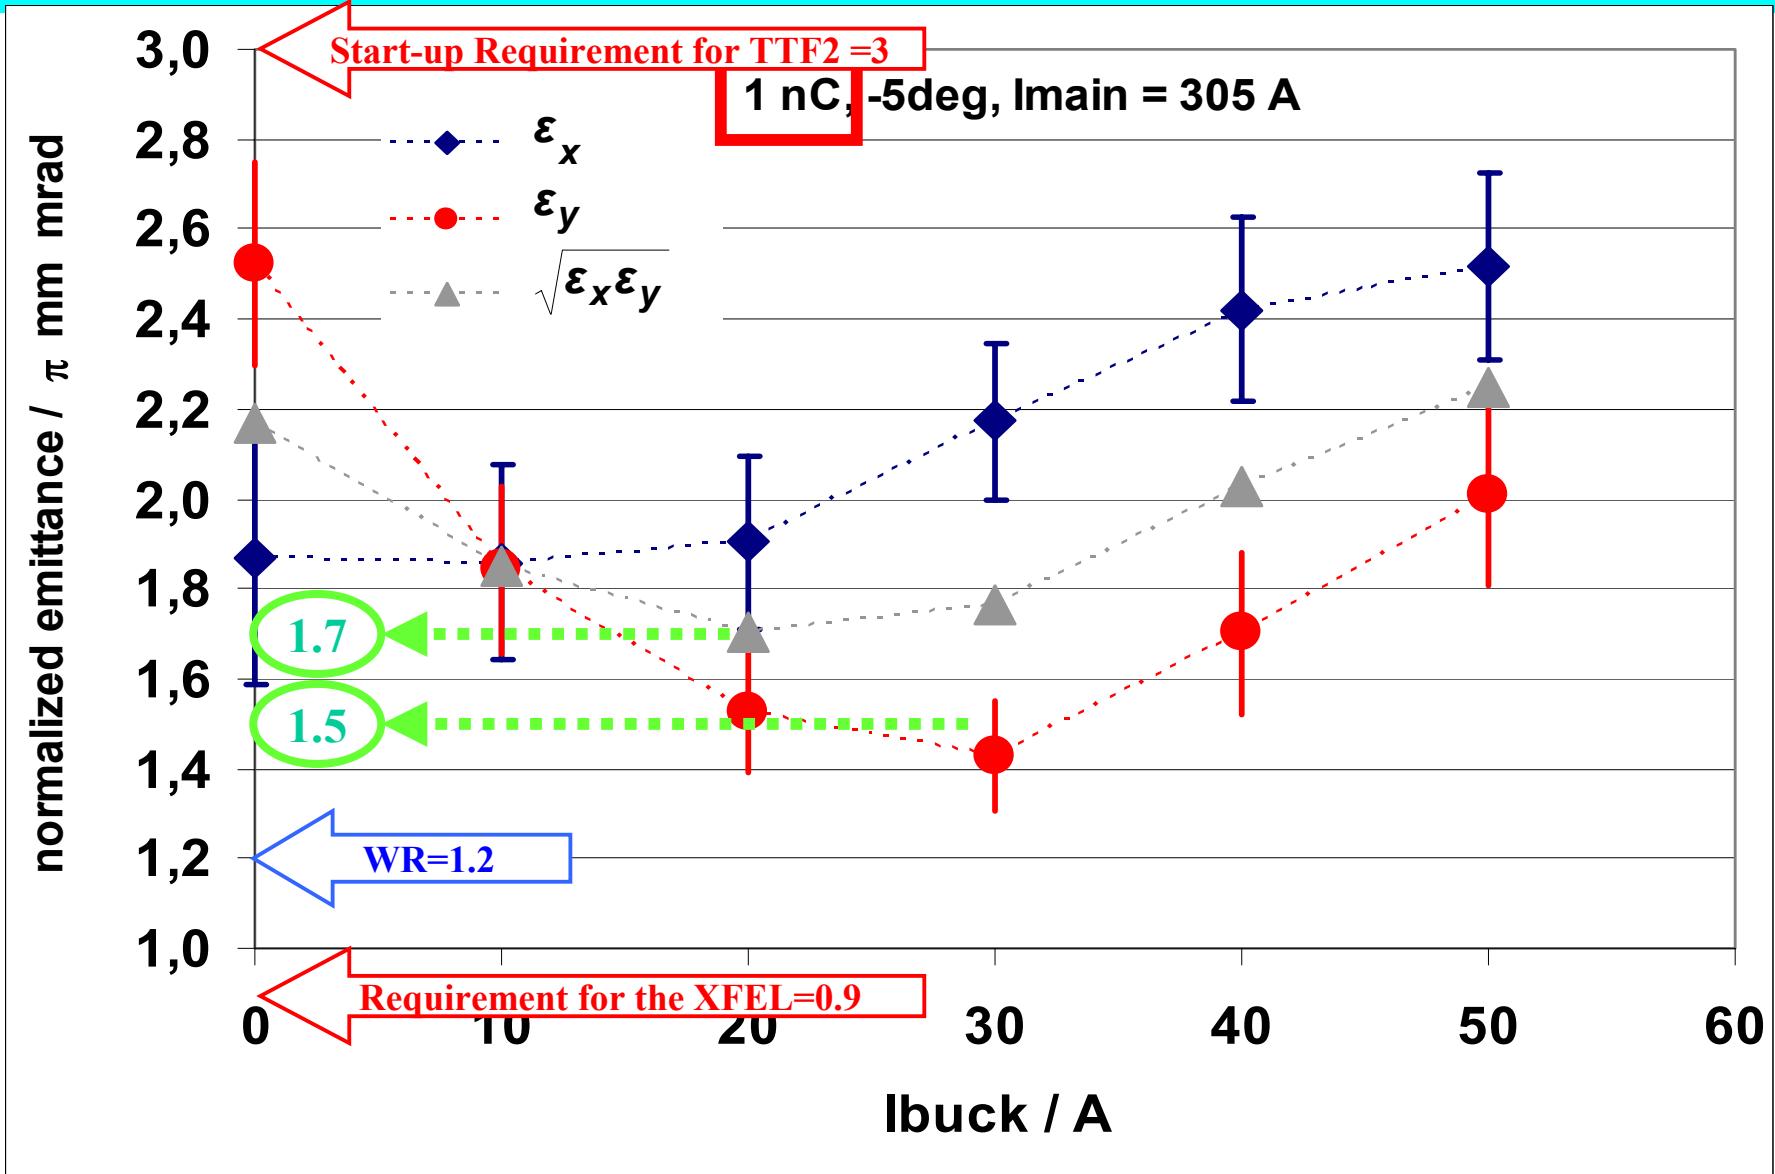

$$\sigma_x = 0.55 \pm 0.02 \text{ mm}$$
$$\sigma_y = 0.61 \pm 0.02 \text{ mm}$$

$\text{FWHM} \approx 21 \text{ ps}; \text{ rise/fall time} \approx 7 \text{ ps}$

# Measured Transverse Emittance vs Bucking Solenoid

Start-up requirement of TTF2 is clearly fulfilled !

# Summary PITZ1

- electron beam was characterized in a wide range of machine parameters (e. g.  $Q$ ,  $\Phi_0$ ,  $I_{\text{main}}$ ,  $I_{\text{buck}}$ , laser parameters)
- optimum settings **@ 1 nC:**

$$\begin{aligned}\sqrt{\varepsilon_x \varepsilon_y} &= 1.7 \pi \text{ mm mrad} \\ \varepsilon_y &= 1.5 \pi \text{ mm mrad}\end{aligned}$$

have been reached with:

longitudinal laser shape:

‘flat top’, FWHM  $\approx 21$  ps, rise/fall time  $\leq 7$  ps

transverse laser profile:

‘homogeneous’,  $\sigma_{x,y} \approx 0.55 - 0.6$  mm

solenoid current:

$I_{\text{main}} \approx 305$  A,  $I_{\text{buck}} \approx 20-25$  A  $\rightarrow B_z = 0$  at cathode

RF parameters:

phase:  $\Phi \approx \Phi_0 - 5^\circ$ , gradient at cathode:  $\sim 42$  MV/m

- cavity is now installed at TTF2

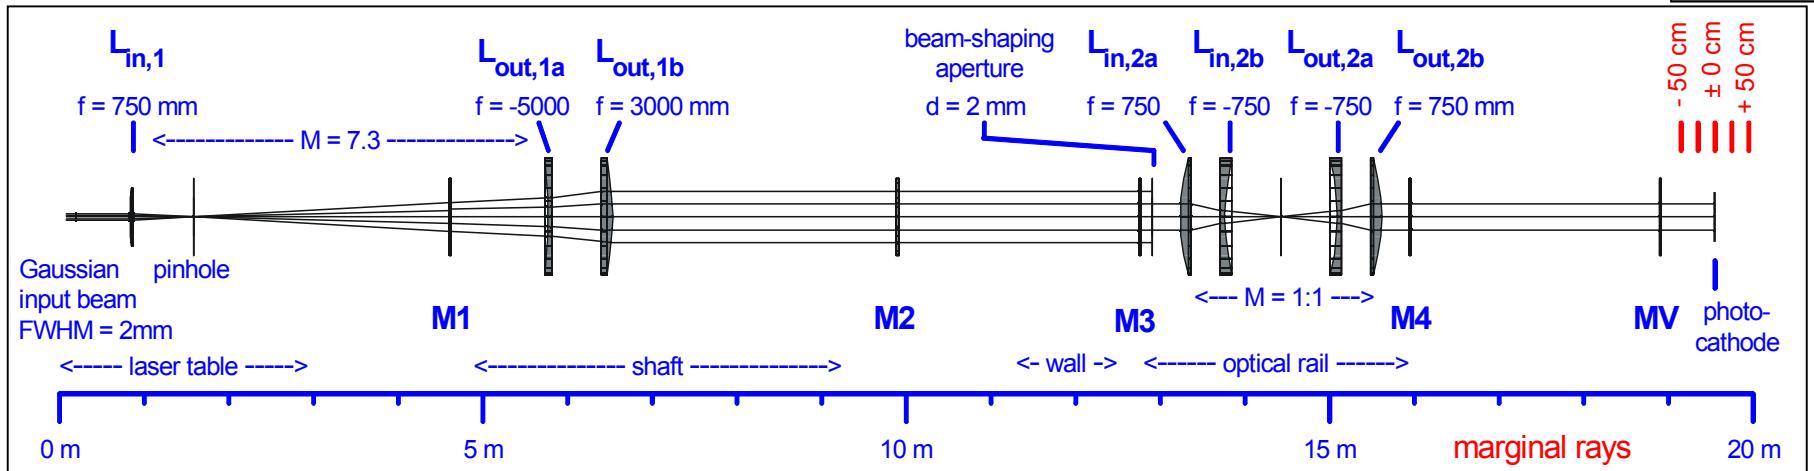

# How to reach the beam quality required for XFEL

**Goal:  $0.9 \pi \text{ mm mrad}$  from the injector for  $10 \text{ Hz}, 650 \mu\text{s} !!$**

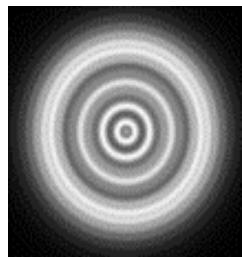

- upgrades with  $\sim 40 \text{ MV/m}$  at the cathode:
  - really homogenous transverse laser profile:
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 1.5 \pi mm mrad @ 1 nC} \quad (\text{ongoing in 2004})$$
  - improved longitudinal laser profile ( 2 ps rise/fall time):
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 1.2 \pi mm mrad @ 1 nC} \quad (\text{realisation in } \sim 2004-2006)$$
- in addition, with  $60 \text{ MV/m}$  at the cathode:
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 0.9 \pi mm mrad @ 1 nC} \quad (\text{started, ongoing in 2004, depending on 10 MW klystron})$$

# How to reach the beam quality required for XFEL

**Goal:  $0.9 \pi \text{ mm mrad}$  from the injector for  $10 \text{ Hz}, 650 \mu\text{s} !!$**

- upgrades with  $\sim 40 \text{ MV/m}$  at the cathode:
  - really homegenous transverse laser profile:
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 1.5 \pi mm mrad @ 1 nC} \quad (\text{ongoing in 2004})$$
  - improved longitudinal laser profile ( 2 ps rise/fall time):
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 1.2 \pi mm mrad @ 1 nC} \quad (\text{realisation in } \sim 2004-2006)$$
- in addition, with  $60 \text{ MV/m}$  at the cathode:
$$\Rightarrow \mathbf{\mathcal{E}_n \sim 0.9 \pi mm mrad @ 1 nC} \quad (\text{started, ongoing in 2004, depending on 10 MW klystron})$$

# Photo Cathode Laser Development for PITZ 2

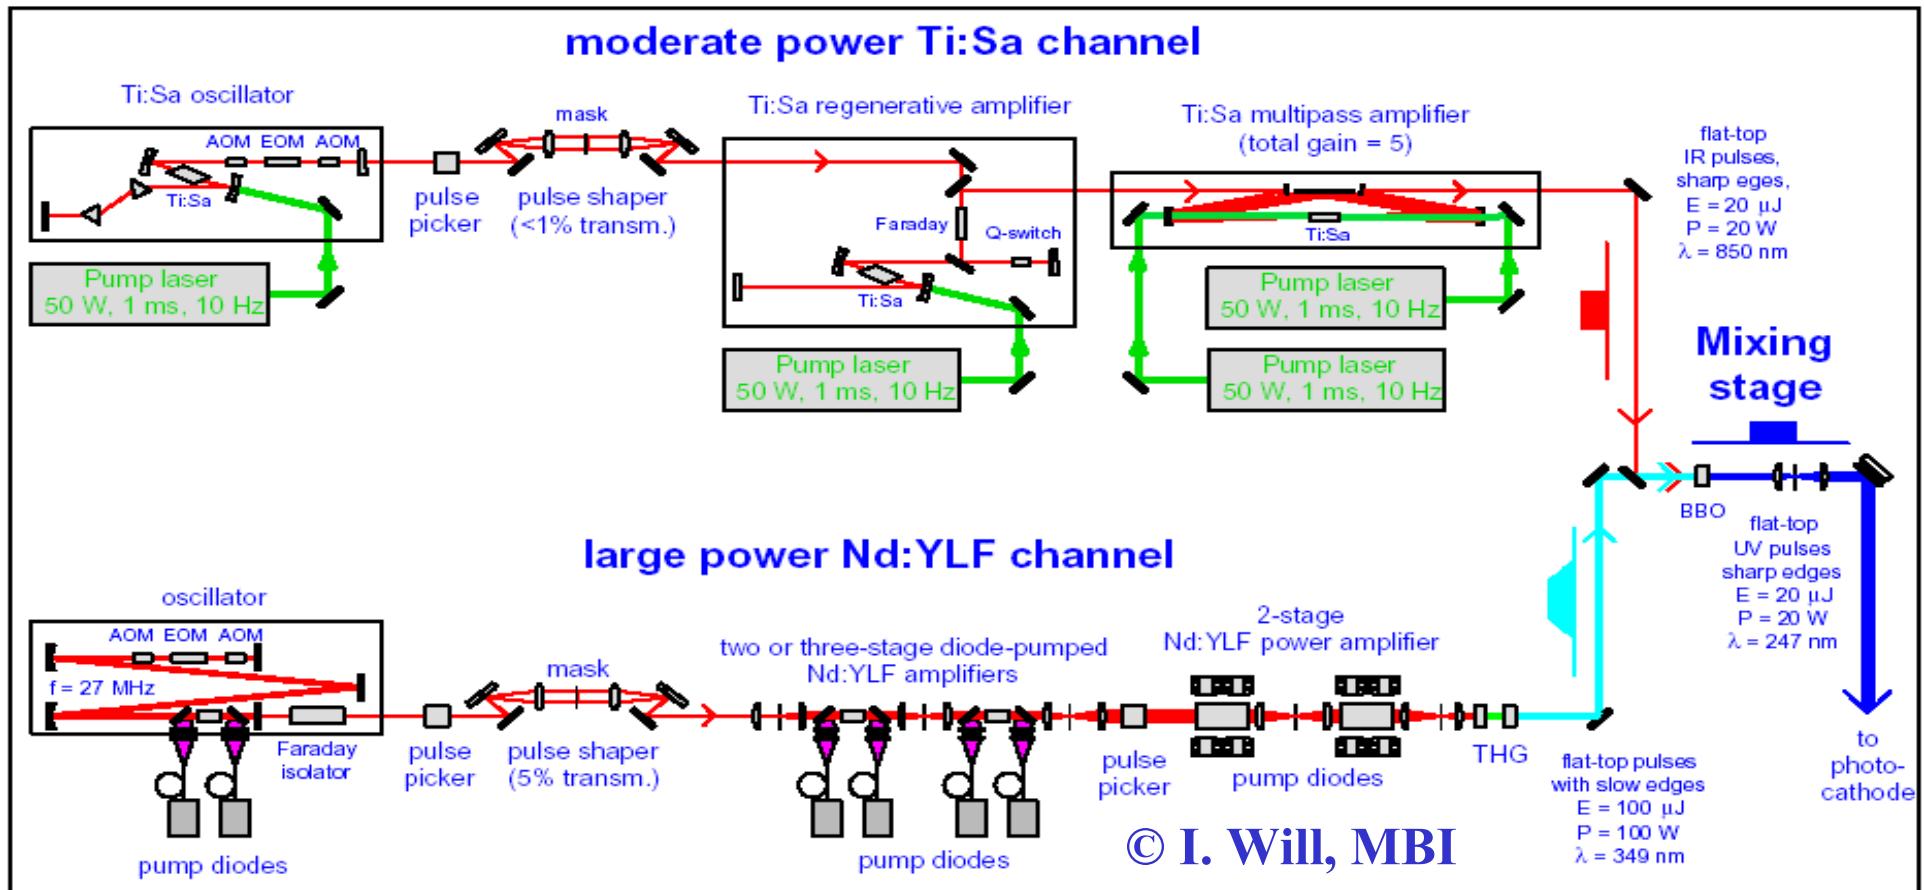

**Goals:** - stable and reliable laser system for **long pulse trains**

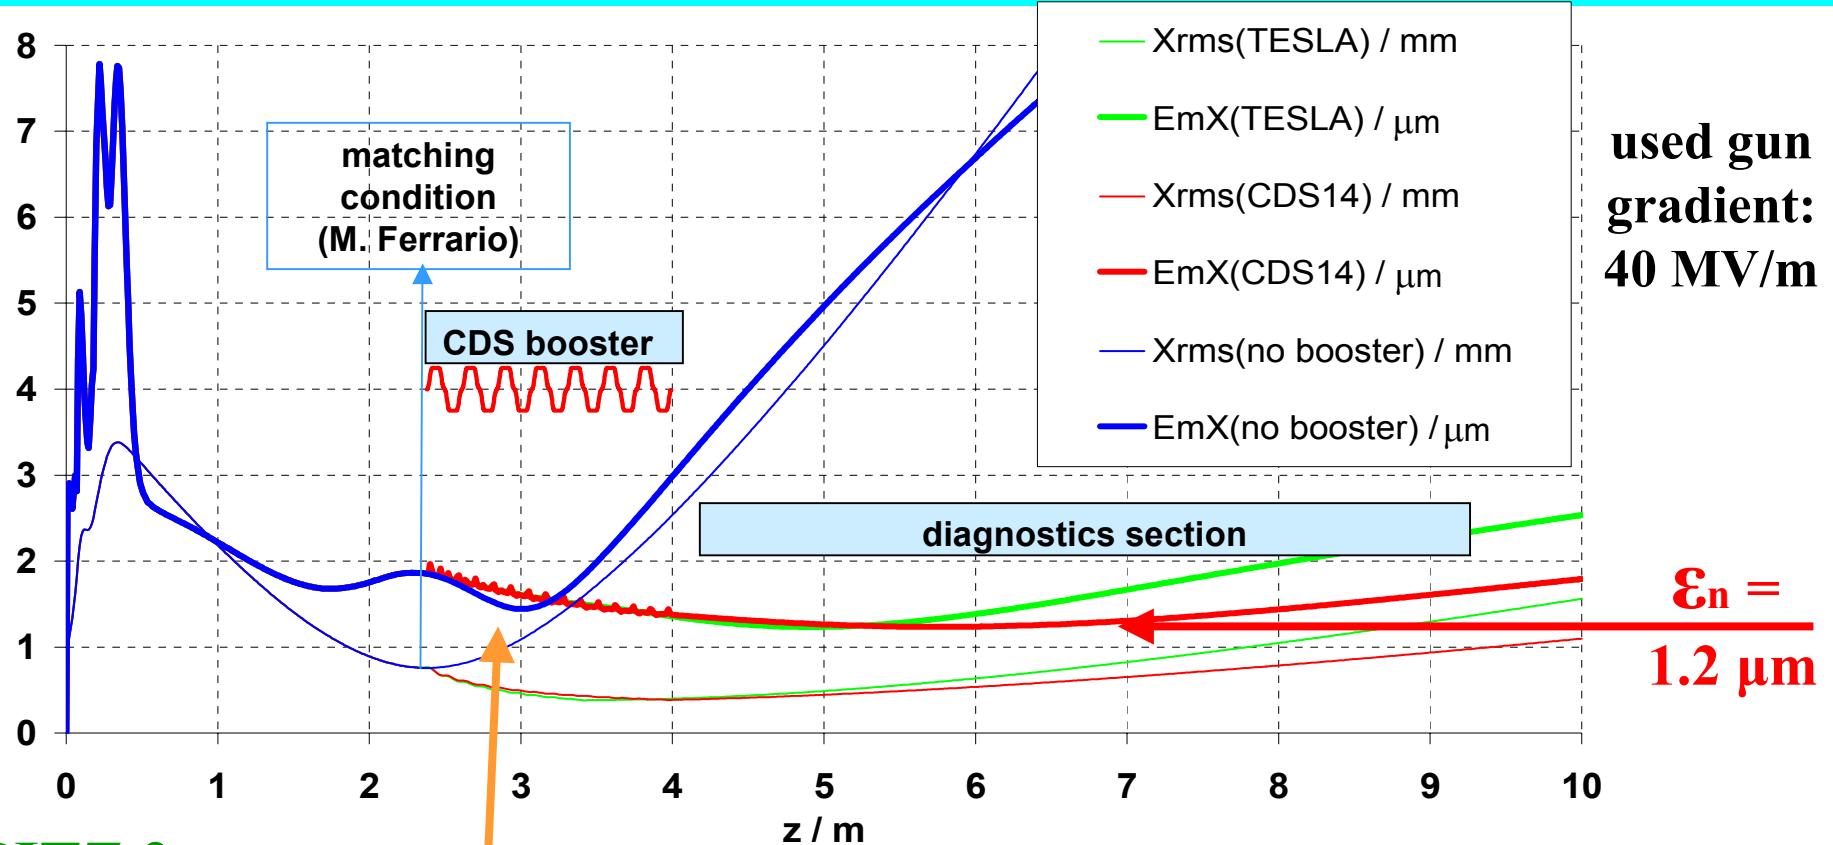

- micropulses temporal profile: **20 ps FWHM,**  
**rise and fall time  $\leq 2$  ps**
- **homogenous** transverse intensity profile
- laser parameters widely **variable**

**Strategy:**

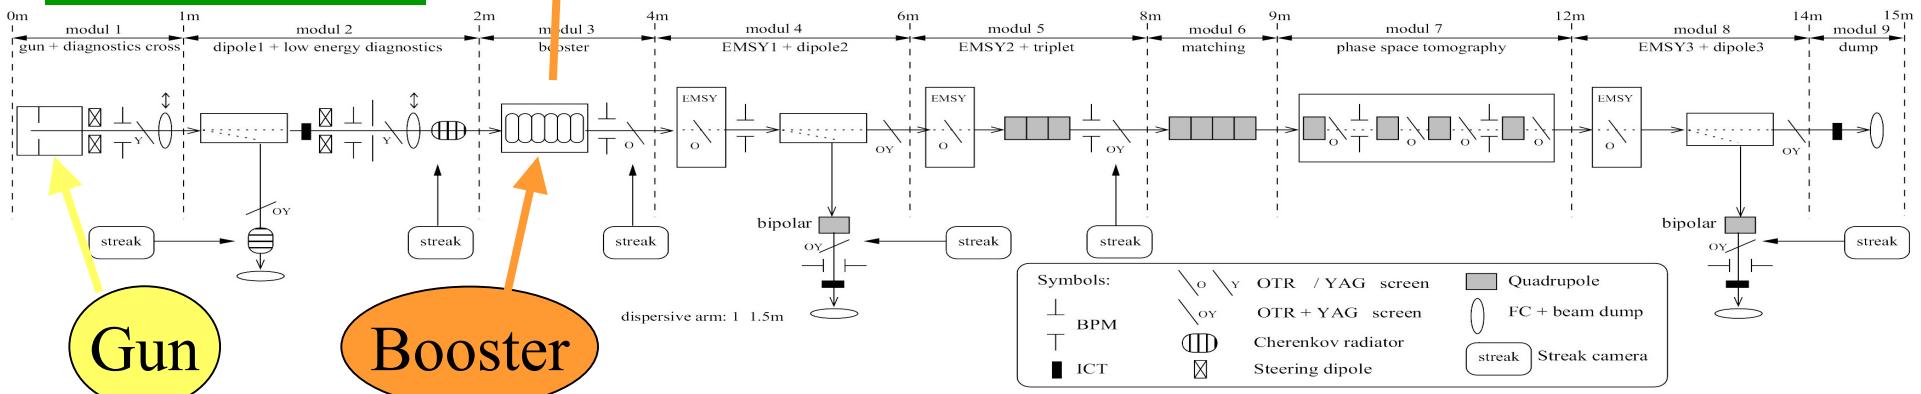

- further improve the Nd:YLF laser system
- two-channel mixing scheme

# ASTRA Simulation of PITZ 2 (20ps FWHM, 2ps rise/fall time)

## PITZ 2 setup:

# How to reach the beam quality required for XFEL

**Goal:  $0.9 \pi \text{ mm mrad}$  from the injector for  $10 \text{ Hz}, 650 \mu\text{s} !!$**
